Executive Summary

This report presents the methods and findings of a supplemental Phase II Environmental Site Assessment (ESA) performed at the Central Virginia Training Center (CVTC). The Virginia Department of Behavioral Health and Developmental Services (DBHDS) is the operator of the facility and is in the process of placing CVTC in a surplus property status.

This Phase II ESA was prepared to further characterize findings and fill data gaps in the 2017 Phase II ESA. The 2017 Phase II ESA assessed the presence or absence of contaminants in soil and groundwater from the high and medium priority findings presented in the Site-Specific Environmental Conditions Assessment (ECA) that was performed by EEE Consulting, Inc. (3e) in July 2017. This ECA identified 23 findings that were determined to be Recognized Environmental Conditions (RECs). The subsequent October 2017 Phase II Environmental Site Assessment (ESA) characterized 19 RECs as High to Medium Risk and four (4) RECs to be of Low Risk. It was determined that no additional characterization was appropriate for 12 of the 19 RECs. This November 2018 Supplemental Phase II ESA focused on the remaining seven (7) RECs and two (2) additional areas that were not characterized in 2017, with the following results:

Table EX-1. Summary of Findings and Results

ECA Finding #	Description	Results	Recommendations
3 and 9	Boiler House Building 77 with 90,000-gallon Heating Oil AST and Coal Ash Cleanup	No impacts from the current and former heating oil ASTs. Two small areas of residual shallow soil impact from heavy metals and combustion products, likely former coal ash residuals.	Recommend eligibility determination and enrollment into the Virginia Department of Environmental Quality's (DEQ) Voluntary Remediation Program (VRP). Excavate two small areas of soil impacts.
10	Former Physical Plant and Laundry	No impacts from the former Physical Plant were found in soil or groundwater to date (current location of Building 47).	No further action warranted.
13	Closed Sanitary Landfill	No groundwater impacts from landfilling activities identified to date; however, the monitoring network is still incomplete. Additional wells will be installed after enrollment into the VRP.	Recommend eligibility determination and enrollment into the VRP because of landfilling operations. Remove discarded surficial debris and dispose in accordance with applicable regulations.
14	New Scrap Yard	No groundwater impacts from landfilling activities identified to date. One additional well may be installed after enrollment into the VRP.	Recommend eligibility determination and enrollment into the VRP because of landfilling operations. Remove discarded surficial debris and dispose in accordance with applicable regulations.
15	Coal Ash and Debris Dump	No groundwater impacts above screening levels to date.	Recommend eligibility determination and enrollment into the VRP because of landfilling operations. Remove discarded surficial debris and dispose in accordance with applicable regulations.
16	Old Scrap Yard	No groundwater impacts from landfilling activities identified to date. Surface soil sampling indicated isolated areas of heavy metal impact.	Recommend eligibility determination and enrollment into the VRP because of landfilling operations. Remove discarded surficial debris and dispose in accordance with applicable regulations.
19	Building 41 (aka Jones House)	Heavy metals (arsenic, hexavalent chromium, and lead) and pesticide impacts to soil surrounding and beneath the building	Recommend demolition of the building in a manner to minimize impacted soil disturbance. Subsequent excavation of impacted soil from grade to two (2)-ft. BGS. Eligibility determination and enrollment to complete these activities under the VRP because of the confirmed impacts to soil from detectable heavy metals and pesticides.
20 & 27	Bulk Pesticide and Oil Storage in Building 39	Heavy metals (arsenic, hexavalent chromium, and lead), petroleum, and pesticide impacts to soil surrounding and beneath the building. Low cadmium concentrations above applicable screening levels in groundwater.	Recommend demolition of the building in a manner to minimize impacted soil disturbance. Subsequent excavation of impacted soil from grade to two (2)-ft. BGS. Eligibility determination and enrollment to complete these activities under the VRP because of the confirmed impacts to soil from detectable hexavalent chromium, lead, banned pesticide, and petroleum concentrations
30	Gasoline UST and Diesel AST at Building 36	Trace concentrations of gasoline indicator compounds were no longer detected in groundwater.	No further action warranted.

This Supplemental Phase II ESA provided additional data on those Findings classified as high and moderate risk to third party (offsite) receptors, human health and the environment. The remaining Findings presented in the July 2017 ECA will require assessment and/or management as part of facility closure; however, many of these Findings are associated with processes currently in use (e.g. the 90,000-gallon heating oil AST at the boiler plant, USTs currently in use, etc.). These operational units may require future environmental management should they be decommissioned or demolished.

A flow chart illustrating a summary of prior, current, and recommended path forward to address future environmental conditions is included as **Figure 3**. As described in Table EX-1 and Figure 3, the next phase of environmental management at CVTC will involve determining the feasibility of enrolling the facility in the Virginia Voluntary Remediation Program (VRP). The goal of enrollment in the VRP will be to carry remedial options that will support the issuance of a Certificate of Satisfactory Completion (CSC). Issuance of a CSC will allow for the transfer of land ownership and a productive redevelopment of the property.

1.0 INTRODUCTION

This report presents the methods and findings of a supplemental Phase II Environmental Site Assessment (ESA) performed to further characterize findings and fill data gaps in the 2017 Phase II ESA within the allotted FY2018 special funds budget at the Central Virginia Training Center (CVTC, aka the Site), a ~380-acre campus located on the northern bank of the James River in Madison Heights, Virginia (**Figure 1**).

1.1. Background

The CVTC property and buildings are currently operated by the Virginia Department of Behavioral Health and Developmental Services (DBHDS). DBHDS is now in the process of placing CVTC in a surplus property status.

To determine the potential environmental liabilities associated with the historic land use of the property, EEE Consulting, Inc. (**3e**) performed a Site-Specific Environmental Conditions Assessment (ECA) in July 2017, which documented a total of 38 Findings within the boundaries of the 380-acre campus as shown on **Figure 2** and supporting ECA **Table 1** (attached to Figure 2 for reference). A subset of these Findings were considered *recognized environmental conditions* (RECs) as defined by ASTM E1527-13 (Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process):

Recognized Environmental Conditions – the presence or likely presence of any hazardous substance or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions.

A flow chart illustrating a summary of prior, current, and recommended environmental activities is included as **Figure 3**.

1.2. Description and Rationale of Work Performed

1.2.1. Phase II ESA (October 2017)

At the request of DBHDS the 38 RECs/Findings identified at CVTC were prioritized with respect to environmental risk, and general estimates of characterization and management cost were presented for each Finding. Due to limitations of available assessment funding, the Phase II ESA was designed to provide preliminary characterization of the high and moderate priority conditions (19 of 38 Findings), with an emphasis of determining the presence or absence of contaminants in groundwater, and potential groundwater migration pathways. The potential for off-site migration

of contaminated groundwater was determined to represent the greatest potential third party risk from the facility.

1.2.2. Supplemental Phase II ESA (November 2018)

This supplemental Phase II ESA was performed to further characterize findings and fill data gaps in the 2017 Phase II ESA, with an emphasis on collection of additional soil and groundwater sampling at prior identified environmental conditions. The following tasks were proposed to meet this objective:

- ❖ Task 2.1: Assess groundwater and soil for impacts pertaining to the current and historic boiler plant operation at Building 77 (ECA Findings #3 and #9). These operations include former outdoor coal pile and fly ash storage with subsequent DEQ-mandated corrective actions, and both former and current above ground heating oil tanks (ASTs) with capacities of 100,000-gallons and 90,000-gallons, respectively.
- ❖ Task 2.2: Resample three (3) monitoring wells installed in 2017 at the former Physical Plant building and suspected fueling area prior to 1975, located within the area of current Building 47 and surrounding land (ECA Finding #10).
- ❖ Task 2.3: Resample two (2) monitoring wells installed in 2017 at the approximately four (4)-acre former sanitary landfill, that was historically in use since the beginning of facility operation until approximately the 1960s (ECA Finding #13).
- ❖ Task 2.4: Resample three (3) monitoring wells installed in 2017 at the Landfill Area dubbed the "New Scrap Yard" (ECA Finding #14).
- ❖ Task 2.5: Resample the monitoring well installed in 2017 at the small landfilled area with construction and demolition debris and coal ash, located west of the greenhouse Building 83 (ECA Finding #15).
- ❖ Task 2.6: Resample the five (5) monitoring wells installed in 2017 at is the six-plus (6+) acre Landfill Area dubbed the "Old Scrap Yard" (ECA Finding #16). Additionally, 24 surface soil samples will be collected at Finding #16 to determine the potential for residual impacts from historic scrap metal and waste handling.
- ❖ Task 2.7: Collect eight (8) samples of surface soil to characterize the reported surface spill of pesticides in and around the bare earth crawl space of Building 41 (ECA Finding #19).

- ❖ Task 2.8: Resample the two (2) permanent groundwater monitoring wells were installed during the 2017 Phase II ESA at the current vehicle fueling area Building 36 (ECA Finding #30).
- ❖ Task 2.9: Assess groundwater and soil for impacts pertaining to the confirmed pesticide and oil impacts to the soil within and surrounding the grounds crew Building 39 (ECA Findings #20 and 27). This data would expand the footprint and data set from the 2017 Phase II ESA by performing the following:
 - Collect incremental sampling within the building.
 - Advancing six (6) additional soil borings.
 - Installing three (3) permanent groundwater monitoring wells.
 - The data from these activities will be used to estimate the volume of impacted soil requiring excavation and off-site treatment/disposal.

Therefore, the *objectives* of this supplemental Phase II ESA were identified as:

- ❖ ASTM E1903-11 §1.2.1 Objective 1 – “Assess whether there has been a *release of hazardous substances* within the meaning of *CERCLA*, for purposes including *landowner liability protections*.”
- ❖ ASTM E1903-11 §1.2.2 Objective 2 – “Provide information relevant to identifying, defining and implementing *landowner continuing obligations*, or the criteria established under *CERCLA* (e.g., taking *reasonable steps* to prevent or limit exposure to previously released *hazardous substances*) for maintaining the *CERCLA landowner liability protections*.”
- ❖ ASTM E1903-11 §1.2.4 Objective 4 – “Provide information relevant to identifying, defining and evaluating property conditions associated with *target analytes* that may pose risk to human health or the environment, or risk of bodily injury to persons on the property and thereby give rise to potential liability in tort.”
- ❖ ASTM E1903-11 §1.2.5 Objective 5 – “Provide information relevant to evaluating and allocating *business environmental risk* in transactional and contractual contexts, including transferring, financing and insuring properties, and due diligence relating thereto.”
- ❖ ASTM E1903-11 §1.2.6 Objective 6 – “Provide information to support disclosure of liabilities and contingent liabilities in financial statements and securities reporting.”

To meet these objectives, **3e** developed a scope of work that served as a project-specific workplan. A site-specific Sampling & Analysis Plan was drafted for internal use, which utilized **3e** Standard Operating Procedures (SOPs) for all field activities (see **Appendix A**).

2.0 PUBLIC CLEARINGS/MARK OUTS

Prior to implementing the soil boring and monitoring well installations, the approximate locations of subsurface public utilities were identified and marked by Miss Utility of Virginia. As most

subsurface utilities present on the Site are owned and operated by CVTC, a private utility locator was contracted to clear the proposed boring and monitoring well locations on September 4, 2018. No damage or disruption to any subsurface utility was reported in response to the work performed under this supplemental Phase II ESA.

3.0 INVESTIGATIVE METHODS

All field activities described in this supplemental Phase II ESA were performed in accordance with **3e** SOPs (**Appendix A**). Deviations to these SOPs, if any, are detailed in the specific Finding section for which they occurred.

3.1. Soil Sampling Methods

All soil sampling was performed from September 5-25, 2018 utilizing the following established SOPs:

- ❖ Collection from a continuous soil core using a direct-push GeoProbe™ type drill rig (**3e** SOP 2.3).
- ❖ Collected from surface soil, less than 12-inches below ground surface (BGS), using a hand auger and/or shovel (**3e** SOP 2.1). This includes aliquots comprising the Incremental Sampling (IS) in Building 39, which was performed in general accordance with US Army Corps of Engineers Interim Guidance 09-02: *Implementation of Incremental Sampling (IS) of Soil for the Military Munitions Response Program*.
- ❖ Copies of bore logs for all continuous soil core borings are included in **Appendix B**.

3.2. Groundwater Sampling Methods

The groundwater monitoring well installations, liquid level measurements, and groundwater sampling were performed between September 19 and October 4, 2018.

- ❖ Groundwater wells were installed into the first permanent aquifer using air rotary drilling technology, and subsequently developed using a submersible pump in accordance with applicable portions of **3e** SOP 2.4.
- ❖ Copies of the bore logs documenting subsurface conditions during the installations of the monitoring wells are included in **Appendix B**.
- ❖ Monitoring well diagrams depicting construction and elevation detail are included in **Appendix D**.
- ❖ Liquid levels (groundwater elevation measurements) were recorded twice during this supplemental Phase II ESA: all wells at CVTC were measured on September 25, 2018 and each well was measured again prior to sample collect in accordance with **3e** SOP 2.5.
- ❖ Groundwater samples were collected using low flow capable bladder pumps in accordance with **3e** SOP 2.7 and general accordance with both EPA's Low-Flow (Minimal Drawdown) Ground-Water Sampling Procedure (EPA/540/S-95/504) and ASTM D6771-02: *Standard*

Practice for Low-Flow Purging and Sampling for Wells and Devices Used for Ground-Water Quality Investigations.

- ❖ All bladder pumps were set within the screened interval, approximately 5-ft from the bottom of each monitoring well.

3.3. Sample Analytical Methods

All media samples collected during this Phase II ESA were handled, transported, and analyzed in accordance with the following protocols:

- ❖ All sample jars/containers were appropriately labeled and placed on ice in a cooler to maintain an appropriate temperature ($< 4^{\circ}\text{C}$) while in transit to the certified environmental laboratory.
- ❖ Chain of Custody (COC) documentation was completed for all samples submitted for laboratory analysis.
- ❖ All samples were analyzed by Air, Water, & Soil Laboratories, Inc. of Richmond, VA in accordance with the EPA Methods appropriate for each finding.
- ❖ The COC documentation and laboratory analytical data are provided in **Appendix E**. Detailed discussions of the laboratory analytical results are presented in each associated Finding sections.

3.4. Survey

3e contracted Thompson & Litton to survey the location and elevation of all additional monitoring wells installed during this supplemental Phase II ESA. This survey information was used to accurately depict well locations and associated site features on figures, and to determine relative elevations to assist in the calculation of hydrologic parameters such as potential hydraulic gradient.

3.5. Investigation Derived Waste

All investigation derived waste (IDW) was managed in accordance with **3e** SOP 1.2. Disposal of drummed cuttings from monitoring well advancement is currently pending. Copies of transportation and disposal documents for these drums will be forwarded to DBHDS upon receipt.

4.0 GEOLOGY & HYDROGEOLOGY

4.1. Geology

According to the USGS Geologic map of Virginia, the Site is in the Proterozoic Z aged Ashe Formation - Biotite gneiss. This metamorphic geological unit consists primarily of medium- to light-gray, massive, conglomeratic biotite schist and gneiss, with feldspar, quartz, and granitic clasts. This bedrock formation was encountered between 5-ft and 38-ft below ground surface (BGS) during installation of the permanent monitoring wells.

4.2. Hydrogeology

Monitoring wells at CVTC were installed within the biotite gneiss member of the Ashe Formation referred to as the Lynchburg Group, which is a part of the Piedmont and Blue Ridge Crystalline Aquifer System. Groundwater in this formation is primarily stored within fractures that develop within rocks due to physical and chemical weathering. The permanent water table potentiometric surface at CVTC was predominantly encountered at approximate depths ranging from 25-83-ft below the top of well casings, with the exception of permanent groundwater table wells advanced at the Boiler Plant (Building 77). Two of these wells were found to be artesian, while the third exhibited a potentiometric surface four (4) feet below the top of well casing. Groundwater elevations ranged from approximately 618-705-ft above mean sea level (amsl). Pertinent groundwater level and elevation data is presented in the following **Table 4.2-1**.

Table 4.2-1 Summary of Groundwater Measurements and Elevations

Well ID	TOC Elevation (feet amsl)	Depth to Groundwater (feet below TOC)			Groundwater Elevation (feet amsl)			Maximum Fluctuation (feet)
		9/27/2017	10/2/2017	9/25/2018	9/27/2017	10/2/2017	9/25/2018

5.0 SCREENING LEVELS

All sample results collected during this Phase II investigation were compared against applicable regulatory screening levels to determine if the results indicated anthropogenic impacts, releases, or potential risk to future development. The selection of appropriate screening levels was based on the regulatory programs associated with each Finding type (e.g. petroleum storage, buried waste, etc.), and screening values were selected from one of more of the following:

- ❖ Regional background studies for naturally occurring heavy metal concentrations in native soil, which were sponsored by the Virginia DEQ.
- ❖ EPA Region 3 Screening Levels, updated May 2018. All soil results were compared to Residential Soil Screening Levels, while Maximum Contaminant Levels (MCLs) were utilized to screen groundwater sample results. These levels were chosen because they are commensurate with the DEQ's Voluntary Remediation Program (VRP) Tier II levels for unrestricted (e.g., residential) site use.
- ❖ The Virginia DEQ guidance for petroleum release reporting in the most recent edition of the Storage Tank Program Technical Manual, which is based on 9VAC25-580-190.

6.0 INVESTIGATIVE RESULTS AND RECOMMENDATIONS PER FINDING

6.1. Findings #3 and #9: Boiler House

6.1.1. Background Summary

Findings #3 and #9 as described in the 2017 ECA refer to the current and historic petroleum ASTs (Finding #3) and the 1996 Executive Compliance Agreement to mitigate environmental risk from the boiler plant Building 77 (Finding #9). Full compliance was obtained in 1999 after performance of the following activities:

- Removal of coal silos and any remaining coal fuel
- Remediation of sediments from the unnamed stream receiving storm water from the boiler plant area.
- Removal of the existing 100,000-gallon No. 6 fuel oil above-ground storage tank (AST).
- Installation of a new 90,000-gallon No. 2 fuel oil AST in full compliance with containment and monitoring requirements.

6.1.2. Investigation Summary

The investigation to determine presence or absence of groundwater and soil impacts due to these current and former activities at the boiler plant (Building 77) included the advancement nine (9)

soil borings with a GeoProbe direct-push rig and installation of three (3) monitoring wells into the permanent groundwater table using an air rotary rig in accordance with **3e** SOPs 2.3 and 2.4, respectively (see **Appendix B**). The location of these borings and monitoring wells are depicted on **Figure 3-1**.

Soil samples were collected from the first and last 5-ft sleeves of each boring, to be representative of soil near the ground surface and directly above the bedrock interface. Due to shallow bedrock refusal, only two (2) sleeves were collected from most of the borings. Additional soil borings and sample intervals were proposed for collection in the event of visual, olfactory, or other field observations indicative of anthropogenic impacts; however, no such impacts were observed during soil sample collection.

Because of current and historic petroleum and coal ash material handling, the following analyses were performed on the representative media samples:

- ❖ Total Petroleum Hydrocarbons – Diesel Range Organics (TPH-DRO) and Oil Range Organics (TPH-ORO) by EPA Method 8015C: all soil and groundwater samples.
- ❖ Semi-volatile Organic Compounds (SVOCs), Polycyclic Aromatic Hydrocarbons (PAHs) and dibenzofurans by EPA Method 8270D: all soil and groundwater samples.
- ❖ Dioxins (2,3,7,8-TCDD) by EPA Method 8270D (SIM) – a very sensitive qualitative analysis used to determine presence/absence: soil samples.
- ❖ Polychlorinated Biphenyls (PCBs) by EPA Method 8082A: soil samples.
- ❖ TAL Metals by EPA Methods 6010C, 6020A and 7470A/7471B: all soil and groundwater samples.
- ❖ Hexavalent Chromium by EPA Method 7196A: all soil and groundwater samples.
- ❖ Volatile Organic Compounds (VOCs) by EPA Method 8260B: all groundwater samples.

6.1.3. Results

6.1.3.1. Soil

The following **Table 6.1-1** presents a summary of the TAL Metals and other detected compounds at Findings #3 and #9. No dioxins, dibenzofurans, or PCBs were detected in the samples. The detailed laboratory report in **Appendix E** includes LOQ, quality control, and quantitative results for all samples and analytes.

A review of **Table 6.1-1** indicates that:

- ❖ Arsenic was detected at total concentrations exceeding the EPA Tier II Site Screening Level (SSL) for unrestricted use; however, only one (1) of the detected concentrations exceeded the 12.41 mg/kg value for naturally occurring arsenic in the Piedmont physiographic province (explained in detail at **Section 8.1**). The arsenic concentration of 15.2 mg/kg in soil boring 77-6 at a depth of 0-5-ft BGS is consistent with documented background values.
- ❖ Hexavalent chromium was detected in three (3) of the samples at total concentrations at, or slightly above, the EPA Tier II SSL of 0.3 mg/kg.
- ❖ Copper was detected in one (1) of the samples at total concentrations slightly above the EPA Tier II SSL of 23 mg/kg.
- ❖ Iron was detected in one (1) of the samples at total concentrations slightly above the EPA Tier II SSL of 55,000 mg/kg.
- ❖ PAHs were elevated in sample 77-4, and both benzo (a) pyrene and benzo (b) fluoranthene exceeded the Tier II SSL.
- ❖ TPH-DRO and TPH-ORO concentrations were present in several of the samples; however, none exceeded their respective Tier II SSL or the Virginia Solid Waste Management Regulations (VSWMR) TPH limit of 50-mg/kg for fill material (9VAC 20-81-660D.2.d).

6.1.3.2. Groundwater

The three (3) monitoring wells at Finding #3 were purged and sampled using low-flow bladder pumps on September 27 and October 1, 2018. The following **Table 6.1-2** summarizes groundwater parameters collected during the purge process method.

Table 6.1-2 Groundwater Purge Details at Finding #3

Well ID	Date	Time*	Purge Volume (gallons)	Temperature (°C)	pH	Conductivity (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Oxidation-Reduction Potential (mV)

		1035	Sample	--	--	--	--	--	--

Notes:

* **Bold** indicates time of sample collection

A review of **Table 6.1-2** indicates that:

- ❖ An adequate purge was performed at each well, per **3e** SOP 2.7 and low-flow sampling guidance.
- ❖ Turbidity decreased significantly in all monitoring wells during the purge; however, it was still elevated in MW 77-1 at time of sample collection. High turbidity (suspended particulates) can contribute to detected concentrations of total metals in the groundwater sample.

Analytical results of groundwater samples collected from these three (3) monitoring wells indicated that no petroleum compounds, SVOCs or VOCs were detected in groundwater. Low concentrations of several TAL metals were detected above the laboratory LOQ at Finding #3, as presented in the following **Table 6.1-3**. The detailed laboratory report in **Appendix E** includes LOQ, quality control, and quantitative results for all samples and analytes.

Table 6.1-3 Summary of Groundwater Detections at Finding #3

Notes:

Bold = Detection

Highlight = Detection exceeds MCL

*EPA Maximum Contaminant Level, May 2018

A review of **Table 6.1-3** indicates that:

- ❖ Total lead was present in MW 77-1 slightly above its MCL of 0.015 mg/l.
- ❖ Hexavalent chromium was not detected in any of the monitoring well samples.
- ❖ Numerous other total TAL metals were detected at concentrations an order of magnitude less than their respective EPA Maximum Contaminant Level (MCL).
- ❖ The elevated total TAL metal concentrations (including lead) in MW 77-1 is likely attributed to turbidity measured at 596 NTU during sample collection (**Table 6.1-2**).

6.1.4. Opinions and Recommendations

The Boiler House (Finding #11) has been determined to not warrant additional characterization because:

- ❖ Concentrations of arsenic exceeded the residential SSL in all soil samples but were determined to be within the naturally occurring range for soil of the Piedmont physiographic province. One (1) soil sample collected at boring 77-6 from 0-6-ft BGS was slightly elevated above the average background concentration. Targeted soil removal could occur at this location to remove this elevated arsenic data point from future human health risk assessment calculations.
- ❖ The occasional concentrations of hexavalent chromium, copper, and iron that exceeded their respective residential SSLs are likely naturally-occurring or background levels and are not likely indicative of anthropogenic sources or releases.
- ❖ All TPH-DRO and ORO concentrations detected were below their respective SSLs and release reporting threshold.
- ❖ The elevated concentrations of PAHs at soil boring 77-4 are likely indicative of prior coal ash combustion products, and as such soil in this area should be excavated to a depth of 5-ft BGS. Post-excavation samples should be collected and analyzed for PAHs to ensure that impacted soil was removed to the maximum extent practicable.
- ❖ Targeted excavation to remove approximately 190 cubic yards (290 tons) of soil to be disposed as non-hazardous solid waste.

Should demolition of the boiler plant (Building 77) and 90,000-gallon heating oil AST occur, such activities must be performed in compliance with all applicable state and local codes, including identification and removal of asbestos containing materials within the structures. Additional information on demolition, AST closure and asbestos requirements are included in **Section 7.0**.

6.2. Finding #10: Former Physical Plant and Laundry

6.2.1. Background Summary

ECA Finding #10 is the location of the original Physical Plant, Laundry, and Carpenter Shop, which is now the location of Building 47. These prior structures were apparently razed for the subsequent construction of Building 47 in the mid-1970s.

6.2.2. Investigation Summary

Both soil and groundwater investigations were performed during the 2017 Phase II ESA, which included the advancement five (5) soil borings with a GeoProbe direct-push rig and installation of three (3) monitoring wells into the permanent groundwater table using an air rotary rig. Resultant soil and groundwater samples did not detect any constituents above their respective SSLs or MCLs. The results of soil and groundwater samples indicate no evidence of relic contamination from prior

Physical Plant operations at Finding #10. Based on this information, no additional characterization was recommended.

As described in Task 2.2, all three (3) groundwater monitoring wells were resampled during this supplemental Phase II ESA. Because historic petroleum, paint and solvent use were determined to be the likely contaminants, the following analyses were performed on the groundwater samples:

- ❖ Total Petroleum Hydrocarbons – Gasoline Range Organics (TPH-GRO) by EPA Method 8015C.
- ❖ TPH-DRO by EPA Method 8015C.
- ❖ VOCs by EPA Method 8260B
- ❖ Total TAL Metals by EPA Methods 6010C, 6020A and 7470A/7471B. Note: only total 8 RCRA metals were analyzed in 2017. With the pending inclusion of the facility into the VRP, total TAL metals were chosen for the resampling in an effort to collect data commensurate with the human health risk assessment process.
- ❖ Hexavalent Chromium by EPA Method 7196A.

6.2.3. Results

All three monitoring wells at Finding #10 were purged and sampled using low-flow bladder pumps on October 1 to 2, 2018. The following **Table 6.2-1** summarizes groundwater parameters collected during the purge process method.

Table 6.2-1 Groundwater Purge Details at Finding #10

Well ID	Date	Time*	Purge Volume (gallons)	Temperature (°C)	pH	Conductivity (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Oxidation-Reduction Potential (mV)

		1740	Sample	--	--	--	--	--	--

Notes:

* **Bold** indicates time of sample collection

A review of **Table 6.1-2** indicates that:

- ❖ An adequate purge was performed at each well, per **3e** SOP 2.7 and low-flow sampling guidance.
- ❖ Turbidity in MW 10-3 did not significantly decrease during the purge. High turbidity (suspended particulates) can contribute to detected concentrations of Total TAL Metals in the groundwater sample.

Analytical results of groundwater samples collected from these three (3) monitoring wells indicated that no petroleum compounds or VOCs were detected in groundwater. Low concentrations of several TAL metals were detected above the laboratory LOQ at Finding #10, as presented in the following **Table 6.2-2**. The detailed laboratory report in **Appendix E** includes LOQ, quality control, and quantitative results for all samples and analytes.

Notes:

Bold = Detection

Highlight = Detection exceeds MCL

*EPA Maximum Contaminant Level, May 2018

A review of **Table 6.2-2** indicates that:

- ❖ Total beryllium and lead were detected slightly above their MCLs in MW 10-3. These and other elevated total TAL metal concentrations in MW 10-3 are likely attributed to turbidity measured at 898 NTU during sample collection (**Table 6.2-1**).
- ❖ Numerous other total TAL metals were detected at concentrations less than their respective EPA Maximum Contaminant Level (MCL).
- ❖ Total chromium was detected in groundwater from 10-3; however, hexavalent chromium was not detected above the LOQ.

6.2.4. Recommendations

The results of soil and groundwater samples collected in 2017 and additional groundwater samples collected in 2018 indicate no evidence of relic contamination from prior Physical Plant operations at Finding #10. Based on this information, no additional characterization is recommended.

6.3. Finding #13: Closed Sanitary Landfill

6.3.1. Background Summary

ECA Finding #13 was the ~4-acre sanitary landfill that operated from approximately 1950 through the 1970s. This landfill was sited in an existing low spot and adjoining ravine, which was subsequently filled over the span of several decades. It is likely that all waste generated by CVTC operation during this time-period was landfilled at this location, and/or burned in the adjoining incinerator (Finding #11), with burial of the resultant combustion products at this location. According to facility staff, friable asbestos pipe insulation may also have been buried in this closed landfill.

6.3.2. Investigation Summary

A groundwater investigation to determine presence or absence of groundwater impacts at Finding #13 commenced during the 2017 Phase II ESA, with the installation of two (2) monitoring wells into the permanent groundwater table using an air rotary rig. Groundwater samples were collected from these wells and surface water samples were collected from Williams Run because it was located directly downgradient from the closed landfill and was identified as the closest sensitive receptor for potential migration of groundwater. The groundwater samples did not detect any constituents above their respective MCLs, and all three stream samples exhibited no significant variation in the detected concentrations between upstream and downstream, indicating no quantifiable impacts from the former landfill. Based on this information, no additional characterization was recommended.

As described in Task 2.3, the two (2) groundwater monitoring wells were resampled during this supplemental Phase II ESA. Because of historic landfill activity, the groundwater samples were analyzed for constituents listed on Appendix II to 40 CFR Part 258—List of Hazardous Inorganic and Organic Constituents (Criteria for Municipal Solid Waste Landfills).

6.3.3. Results

Both monitoring wells at Finding #13 were purged and sampled using low-flow bladder pumps on October 2, 2018. The following **Table 6.3-1** summarizes groundwater parameters collected during the purge process method.

Table 6.3-1 Groundwater Purge Details at Finding #13

Well ID	Date	Time*	Purge Volume (gallons)	Temperature (°C)	pH	Conductivity (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Oxidation-Reduction Potential (mV)
MW 13-1	10/2/2018	1115	0.1	17.44	6.32	0.234	371	6.26	205
		1120	0.5	16.53	5.88	0.167	302	2.48	215
		1125	0.8	16.13	5.6	0.133	119	1.75	235
		1130	1.2	16.12	5.66	0.131	64.7	1.5	242
		1135	1.5	16.07	5.61	0.128	37.6	1.29	249
		1140	1.8	15.95	5.61	0.126	24.0	1.26	252
		1145	Sample	--	--	--	--	--	--
MW 13-2	10/2/2018	1345	0.1	17.9	5.95	0.39	1000	2.44	238
		1350	0.5	16.59	5.87	0.369	335	0.0	244
		1355	0.9	16.44	5.80	0.326	104	0.0	247
		1400	1.3	16.32	5.78	0.309	30.6	0.0	250
		1405	1.7	16.38	5.80	0.311	8.5	0.0	252
		1410	2.1	16.36	5.86	0.328	4.2	0.0	252
		1415	Sample	--	--	--	--	--	--

Notes:

* **Bold** indicates time of sample collection

A review of **Table 6.3-1** indicates that:

- ❖ An adequate purge was performed at each well, per **3e** SOP 2.7 and low-flow sampling guidance.
- ❖ Turbidity was very low in both wells at the time of collection, indicating that any total metals in groundwater samples would likely be dissolved in the aquifer.

Analytical results of the representative groundwater and surface water samples indicate that herbicides, pesticides, VOCs, or SVOCs were not present at detectable concentrations. Low total concentrations of barium were detected above the laboratory LOQ in groundwater at concentrations commensurate with prior results of October 2017, while mercury was not detected in MW 13-2 in 2018, as presented in the following **Table 6.3-2**. The detailed laboratory report in **Appendix E** includes LOQ, quality control, and quantitative results for all samples and analytes.

Table 6.3-2 Summary of Groundwater and Surface Water Detections at Finding #13

Well ID		MW 13-1		MW 13-2		S1 (midpoint)	S2 (upstream)	S3 (downstream)	EPA MCL*	
Lab ID		17J0155-05	18J0081-03	17J0155-06	18J0081-04	17J0515-01	17J0515-02	17J0515-03		
Date Collected		10/2/2017	10/2/2018	10/2/2017	10/2/2018	10/16/2017	10/16/2017	10/16/2017		
Analyte	CAS	Units	Result		Result		Result	Result	Result	
Arsenic	7440-38-2	mg/l	< 0.001	< 0.001	< 0.001	< 0.001	0.0012	0.0011	0.0011	0.01

Notes:

Bold = Detection

*EPA Maximum Contaminant Level, May 2018

A review of **Table 6.3-2** indicates that:

- ❖ Barium was detected in all groundwater (2017 and 2018) and surface water samples (2017), at concentrations two orders of magnitude less than the MCL of 2.0 mg/l.

- ❖ Total arsenic was detected in all surface water samples from Williams Run in 2017, at concentrations an order of magnitude less than the MCL of 0.01 mg/l.
- ❖ Mercury was detected in groundwater from MW 13-2 in October 2017 at an order of magnitude less than the MCL of 0.002 mg/l but was no longer detected above the LOQ in the recent sampling event.
- ❖ All three stream samples in 2017 exhibited no significant variation in the detected concentrations, indicating no quantifiable impacts from the former landfill.

6.3.4. Recommendations

While no detected groundwater constituents exceeded their respective MCLs, the groundwater monitoring well network is incomplete at this time, as additional monitoring wells were not planned during this supplemental Phase II ESA.

Because this Finding #13 is a former sanitary landfill predating modern permitting requirements, it has had no prior assessment, boundary survey, or other protections afforded by commensurate landfills that have operated under a permit. Therefore, it should be enrolled into the Virginia DEQ's Voluntary Remediation Program (VRP) to obtain a Certification of Satisfactory Completion of Remediation. Additional information on the process and protections afforded by the VRP is included in **Section 8.2**.

The VRP process for this former sanitary landfill would likely include the following general activities:

- ❖ Determine site eligibility and apply for enrollment into the VRP.
- ❖ Delineate the extent of buried waste using non-intrusive geophysical testing (terrain conductivity) and ground penetrating radar (GPR).
- ❖ Confirm the waste limits with a direct-push GeoProbe drill rig.
- ❖ Collect soil samples and determine the thickness of the existing landfill cap.
- ❖ Remove and properly dispose of all debris exposed and/or dispersed at the ground surface.
- ❖ Survey locate the bounds of waste and the limits of the VRP Site.
- ❖ Enter an access agreement with neighboring property owner(s) to install at least one (1) downgradient monitoring well. It has been determined that this lowland area is a forested wetland (see letter in **Appendix F**). Any monitoring well installed in this area would be constructed by hand auger (no mobile equipment).
- ❖ Collect deep soil gas samples within and adjoining the delineated limits of waste.
- ❖ Perform at least two (2) complete rounds of groundwater sampling.
- ❖ Subdivide the landfill from the larger CVTC parcel, and record land use restrictions into the deed for this VRP Site.
- ❖ Determine if the specification and placement of additional cap material (clay) is warranted.

6.4. Finding #14: New Scrap Yard

6.4.1. Background Summary

ECA Finding #14 was the area identified as the “New Scrap Yard” by an undated facility map. This area contained evidence of fill piles and large ground disturbances, while historic aerial photographs and interviews indicate that the southern portion was used to landfill debris. The investigation to determine presence or absence of groundwater impacts at Finding #14 began in the 2017 Phase II ESA, which included the installation of three (3) monitoring wells into the permanent groundwater table using an air rotary rig and subsequent groundwater sample analysis. The locations of these monitoring wells are depicted on **Figure 14-1**.

6.4.2. Investigation Summary

As described in Task 2.4, the three (3) groundwater monitoring wells were resampled during this supplemental Phase II ESA. Because of historic landfill activity, the groundwater samples were analyzed for constituents listed on Appendix II to 40 CFR Part 258—List of Hazardous Inorganic and Organic Constituents (Criteria for Municipal Solid Waste Landfills).

6.4.3. Results

All three (3) monitoring wells at Finding #14 were purged and sampled using low-flow bladder pumps on October 2-3, 2017. The following **Table 6.4-1** summarizes groundwater parameters collected during the purge process method.

Table 6.4-1 Groundwater Purge Details at Finding #14

Well ID	Date	Time*	Purge Volume (gallons)	Temperature (°C)	pH	Conductivity (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Oxidation-Reduction Potential (mV)

		1510	1.3	18.17	6.08	0.180	33.4	2.23	235
		1515	1.7	18.06	6.15	0.187	29.1	2.18	233
		1520	Sample	--	--	--	--	--	--

Notes:

* **Bold** indicates time of sample collection

A review of **Table 6.4-1** indicates that:

- ❖ An adequate purge was performed at each well, per **3e** SOP 2.7 and low-flow sampling guidance.
- ❖ Turbidity in monitoring well MW 14-2 did not significantly decrease during the purge. High turbidity (suspended particulates) can contribute to elevated concentrations of metals in the groundwater samples.

Analytical results of the groundwater samples collected from these three (3) monitoring wells indicated that herbicides, pesticides, and VOCs were not present in groundwater at detectable concentrations. Low concentrations of select heavy metals were detected above the laboratory LOQ at Finding #14, as presented in the following **Table 6.4-2**. The detailed laboratory report in **Appendix EF** includes LOQ, quality control, and quantitative results for all samples and analytes.

Table 6.4-2 Summary of Groundwater Detections at Finding #14

Well ID		MW 14-1		MW 14-2		MW 14-3		EPA MCL*	
Lab ID		17J0112-04	18J0081-06	17J0112-05	18J0154-01	17J0112-06	18J0081-05		
Date Collected		10/3/2017	10/2/2018	10/3/2017	10/3/2018	10/3/2017	10/2/2018

Notes:

Bold = Detection

Highlight = Detection exceeds MCL

*EPA Maximum Contaminant Level, May 2018

A review of **Table 6.4-2** indicates that:

- ❖ The single one incidence of bis (2-ethylhexyl) phthalate (a plasticizer) in MW 14-3 during the 2017 Phase II ESA was not detected in 2018 resampling event. Phthalates are common laboratory contaminants.
- ❖ Arsenic, barium, and zinc were detected at low concentrations in all groundwater samples in October 2017 and 2018. The detected arsenic and barium concentrations were at least an order of magnitude less than their respective MCLs. Zinc does not have an EPA MCL.
- ❖ Cobalt, Chromium, Copper, Lead, and Vanadium were also detected in MW 14-2, with lead detected above its MCL of 0.015 mg/l. Hexavalent chromium was not detected MW 14-2.
- ❖ The elevated total metal concentrations in MW 14-2 are likely attributed to turbidity measured at 792 NTU during sample collection (**Table 6.4-1**).

6.4.4. Recommendations

Because this Finding #14 is a former scrap yard and an apparent demolition debris landfill predating modern permitting requirements, it has had no prior assessment, boundary survey, or other protections afforded commensurate landfills that have operated under a permit. Therefore, it should be enrolled into the Virginia DEQ's VRP to obtain a Certification of Satisfactory Completion of Remediation. Additional information on the process and protections afforded by the VRP is included in **Section 8.2**.

The VRP process for this former scrap yard and demolition debris landfill would likely include the following general activities:

- ❖ Determine site eligibility and apply for enrollment into the VRP.
- ❖ Delineate the extent of buried waste using non-intrusive geophysical testing (terrain conductivity) and ground penetrating radar (GPR).

- ❖ Confirm the waste limits with a direct-push GeoProbe drill rig.
- ❖ Collect soil samples and determine the thickness of the existing landfill cap.
- ❖ Remove and properly dispose of all debris exposed and/or dispersed at the ground surface.
- ❖ Survey locate the bounds of waste and the limits of the VRP Site.
- ❖ Install one (1) additional monitoring well west of this area, which will likely require installation of an access road to allow both drill rig and future monitoring well access.
- ❖ Collect deep soil gas samples within and adjoining the delineated limits of waste.
- ❖ Perform at least two (2) complete rounds of groundwater sampling.
- ❖ Subdivide the landfill from the larger CVTC parcel, and record land use restrictions into the deed for this VRP Site.
- ❖ Determine if the specification and placement of additional cap material (clay) is warranted.

6.5. Finding #15: Coal Ash and Debris Dump

6.5.1. Background Summary

ECA Finding #15 was a small (less than 1-acre) area in the wooded ravine immediately west of the greenhouse (Building 83), where mounds of coal ash and partially buried construction debris were observed. One (1) monitoring well (MW 15-1) was installed immediately below the waste into the permanent groundwater table using an air rotary rig during the October 2017 Phase II ESA. Analytical results of the groundwater sample collected from monitoring well 15-1 indicated that only two compounds were detected above the laboratory LOQ at Finding #15: chloroform (a VOC) and barium (a heavy metal), both at concentrations below their respective MCLs.

6.5.2. Investigation Summary

As described in Task 2.5, MW 15-1 was resampled during this supplemental Phase II ESA. This well was installed proximate to Finding #16, therefore its location is depicted on **Figure 16-1**. Because the coal ash and debris indicated landfilling activities, the groundwater sample was analyzed for constituents listed on Appendix II to 40 CFR Part 258—List of Hazardous Inorganic and Organic Constituents (Criteria for Municipal Solid Waste Landfills).

6.5.3. Results

The monitoring well at Finding #15 was installed immediately down gradient of the partially buried coal ash and demolition debris piles. This monitoring well was purged and sampled using a low-flow bladder pump on October 3, 2018. The following **Table 6.5-1** summarizes groundwater parameters collected during the purge process method.

Table 6.5-1 Groundwater Purge Details at Finding #15

Well ID	Date	Time*	Purge Volume (gallons)	Temperature (°C)	pH	Conductivity (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Oxidation-Reduction Potential (mV)
MW 15-1	10/3/2018	1057	0.1	17.50	6.09	0.167	628	11.06	192
		1102	0.4	14.87	5.34	0.175	132.0	7.13	257
		1107	0.8	15.17	5.34	0.173	82.5	6.98	265
		1112	1.2	15.19	5.33	0.173	29.3	7.06	279
		1117	1.6	14.98	5.32	0.172	14.9	7.10	283
		1122	2.0	14.90	5.34	0.172	10.8	6.92	236
		1127	2.5	14.90	5.34	0.171	8.9	6.9	285
		1130	Sample	--	--	--	--	--	--

Notes:

* **Bold** indicates time of sample collection

A review of **Table 6.5-1** indicates that:

- ❖ An adequate purge was performed at this well, per **3e** SOP 2.7 and low-flow sampling guidance.
- ❖ Turbidity in MW 15-1 decreased significantly during the purge.

Analytical results of the groundwater sample collected from MW 15-1 indicated that only two compounds were detected above the laboratory LOQ at Finding #15: chloroform (a VOC) and barium (a heavy metal), as presented in the following **Table 6.5-2**. The detailed laboratory report in **Appendix F** includes LOQ, quality control, and quantitative results for all samples and analytes.

Table 6.5-2 Summary of Groundwater Detections at Finding #15

Well ID		MW 15-1		EPA MCL*
Lab ID		17J0112-07	18J0154-03	
Date Collected		10/3/2017	10/3/2018	
Analyte	CAS	Units	Result	(mg/l)
Chloroform	67-66-3	mg/l	0.00134 0.00107	0.08
Barium	7440-39-3	mg/l	0.0496 0.0624	2.0

Notes:

Bold = Detection

*EPA Maximum Contaminant Level, May 2018

A review of **Table 6.5-2** indicates that:

- ❖ Both barium and chloroform were detected in both 2017 and 2018, but at concentrations at least an order of magnitude less than their respective MCLs.
- ❖ While chloroform can be attributed to laboratory cross contamination when also present at low concentrations in the trip blanks submitted and analyzed as part of the QA/QC process, neither trip blank (2017 or 2018) contained chloroform above the LOQ of 0.0005 mg/l. Additionally, because it was present in both sampling event, this low concentration of chloroform could be classified as groundwater impact proximate to Finding #15.

6.5.4. Recommendations

While chloroform impact has been confirmed in MW 15-1, it is consistently below the MCL. Because groundwater is great than 15-ft BGS, vapor intrusion scenarios would not apply during risk assessment; therefore, expansion of the monitoring well network (installation of additional wells) is not warranted.

Because this Finding #15 could be considered an uncontrolled dump, or unpermitted waste area containing coal ash and demolition debris, it should be enrolled into the Virginia DEQ's VRP to obtain a Certification of Satisfactory Completion of Remediation. Additional information on the process and protections afforded by the VRP is included in **Section 8.2**.

The VRP process for this area would likely include the following general activities:

- ❖ Determine site eligibility and apply for enrollment into the VRP.
- ❖ Due to the smaller area and apparent lesser amount of total wastes, all coal ash and disposed demolition debris should be characterized for waste classification and then removed from Finding #15 and properly disposed of according to waste characteristics (e.g. hazardous or non-hazardous).
- ❖ Collect soil samples after excavation of wastes to demonstrate completion and establish risk.
- ❖ Survey locate the bounds of disturbance and the limits of the VRP Site.
- ❖ Collect a deep soil gas sample within the former area of waste after excavation is complete.
- ❖ Perform at final groundwater sampling event.
- ❖ If risk assessment indicates a potential risk, , then subdivide this area from the larger CVTC parcel, and record land use restrictions into the deed for this VRP Site.

6.6. Finding #16: Old Scrap Yard

6.6.1. Background Summary

ECA Finding #16 was the area identified as the "Old Scrap Yard" by an undated facility map. This area contained evidence of dead or distressed vegetation on the forest floor, construction debris and significant amounts of suspect asbestos tile protruding from the ground, several piles of discarded 55-gallon drums, and other evidence indicating that this area was a combined metal scrap yard and construction debris landfill. Suspect coal ash material was also observed on the forested ground surface in several areas within the area of Finding #16.

The investigation to determine presence or absence of groundwater impacts at Finding #16 began in the 2017 Phase II ESA, which included the installation of five (5) monitoring wells into the permanent groundwater table using an air rotary rig and subsequent groundwater sample analysis.

6.6.2. Investigation Summary

6.6.2.1. Surface Soil

A total of 24 grab samples of surface soil (0-12-inches BGS) were collected within the “Old Scrap Yard” (Finding #16) to determine the potential for residual impacts from historic scrap metal and waste handling. Samples were collected in accordance with 3e SOP 2.1. Because of historic landfill and metal scrapyards activities, the following analyses were performed on the representative media samples:

- ❖ TPH-GRO, TPH-DRO, and TPH-ORO by EPA Method 8015C.
- ❖ SVOCs, PAHs and dibenzofurans by EPA Method 8270D.
- ❖ Dioxins (2,3,7,8-TCDD) by EPA Method 8270D (SIM) – a very sensitive qualitative analysis used to determine presence/absence.
- ❖ Polychlorinated Biphenyls (PCBs) by EPA Method 8082A.
- ❖ TAL Metals by EPA Methods 6010C, 6020A and 7470A.
- ❖ Hexavalent Chromium by EPA Method 7196A: all soil and groundwater samples.

6.6.2.2. Groundwater

As described in Task 2.6, the five (5) monitoring wells were resampled during this supplemental Phase II ESA. This well was installed proximate to Finding #16, therefore its location is depicted on **Figure 16-1**. Because of historic debris disposal, buried demolition waste, and scrap yarding activity, the groundwater samples were analyzed for constituents listed on Appendix II to 40 CFR Part 258—List of Hazardous Inorganic and Organic Constituents (Criteria for Municipal Solid Waste Landfills).

6.6.3. Results

6.6.3.1. Soil

The following **Table 6.6-1** presents a summary of the TAL Metals and other detected compounds at Findings #16. No dioxins, dibenzofurans, or SVOCs were detected in the samples. The detailed laboratory report in **Appendix E** includes LOQ, quality control, and quantitative results for all samples and analytes.

A review of **Table 6.6-1** indicates that:

- ❖ Arsenic was detected at total concentrations exceeding the EPA Tier II SSL for unrestricted use; however, none of the detected concentrations exceeded the 12.41 mg/kg threshold for naturally occurring arsenic in the Piedmont physiographic province (explained in detail at **Section 8.1**).
- ❖ Hexavalent chromium in three (3) of the sample locations was detected at concentrations above the EPA Tier II SSL of 0.3 mg/kg. One sample (16-S24) contained a hexavalent chromium concentration of 30.6 mg/kg.
- ❖ TPH-GRO, DRO, and ORO concentrations were present in several of the samples; however, none exceeded their respective Tier II SSL or the Virginia Solid Waste Management Regulations (VSWMR) TPH limit of 50-mg/kg for fill material (9VAC 20-81-660D.2.d).
- ❖ Low concentrations of PCBs were detected at one sample location (16-S6); however, the concentrations were both below their respective SSLs and the Toxic Substance Control Act (TSCA) PCB cleanup threshold of 1 mg/kg.

6.6.4. Groundwater

The monitoring wells at Finding #16 were purged and sampled using low-flow bladder pumps on October 3-4, 2018. The following **Table 6.6-2** summarizes groundwater parameters collected during the purge process method.

Table 6.6-2 Groundwater Purge Details at Finding #16

Well ID	Date	Time*	Purge Volume (gallons)	Temperature (°C)	pH	Conductivity (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Oxidation-Reduction Potential (mV)

Notes:

* **Bold** indicates time of sample collection

A review of **Table 6.6-2** indicates that:

- ❖ An adequate purge was performed at each well, per **3e** SOP 2.7 and low-flow sampling guidance.
- ❖ Turbidity decreased significantly in all five (5) monitoring wells, although MW 16-5 still exhibited elevated turbidity at the time of sample collection.

Analytical results of samples collected from these five (5) monitoring wells indicated that low concentrations of barium were detected in all monitoring wells at Finding #16. The two polycyclic

aromatic hydrocarbons (PAHs) detected at MW 16-2 in October 2017 were not present above the laboratory LOQ in October 2018. These results are presented in the following **Table 6.6-3**. The detailed laboratory report in **Appendix E** includes LOQ, quality control, and quantitative results for all samples and analytes.

Notes:

Bold = Detection

Highlight = Detection exceeds MCL

*EPA Maximum Contaminant Level, May 2018

A review of **Table 6.6-3** indicates that:

- ❖ The total barium concentration detections in all groundwater samples were at least an order of magnitude less than the respective MCL of 2.0 mg/l.
- ❖ The two PAHs (benzo (a) anthracene and benzo (a) pyrene) detected in MW 16-2 during the October 2017 sampling event were not detected above the LOQ in October 2018.
- ❖ The low concentration or total arsenic in MW 16-5 was an order of magnitude less than the MCL of 0.01 mg/l and is likely attributed to turbidity measured at 299 NTU during sample collection (**Table 6.6-2**).

6.6.5. Recommendations

Because Finding #16 is a former scrap yard and an apparent demolition debris landfill predating modern permitting requirements, it has had no prior assessment, boundary survey, or other protections afforded commensurate landfills that have operated under a permit. Therefore, it should be enrolled into the Virginia DEQ's VRP to obtain a Certification of Satisfactory Completion of Remediation. Additional information on the process and protections afforded by the VRP is included in **Section 8.2**.

The VRP process for this former scrap yard and demolition debris landfill would likely include the following general activities:

- ❖ Determine site eligibility and apply for enrollment into the VRP.
- ❖ Delineate the extent of buried waste using non-intrusive geophysical testing (terrain conductivity) and GPR.
- ❖ Confirm the waste limits with a direct-push GeoProbe drill rig.
- ❖ Delineate the horizontal extent of hexavalent chromium impact near soil sample 16-S24.
- ❖ Determine the thickness of the existing landfill cap.
- ❖ Remove and properly dispose of all debris exposed and/or dispersed at the ground surface.

- ❖ Survey locate the bounds of waste and the limits of the VRP Site.
- ❖ Collect deep soil gas samples within and adjoining the delineated limits of waste.
- ❖ Perform at least two (2) complete rounds of groundwater sampling.
- ❖ Subdivide the landfill from the larger CVTC parcel, and record land use restrictions into the deed for this VRP Site.
- ❖ Determine if the specification and placement of additional cap material (clay) is warranted.

6.7. Finding #19: Suspect Pesticide Spill at Building 41

6.7.1. Background Summary

As reported in the 2017 ECA, according to the CVTC Safety Officer, a cardboard container of pesticide was stored in the earthen floor crawl space of Building 41 (aka The Jones House), a one-story dilapidated building in the southeastern portion of CVTC. This container had reportedly disintegrated and released the pesticide into the crawl space beneath Building 41.

6.7.2. Investigation Summary

On September 5, 2018 **3e** staff collected surface (0-6-inches BGS) soil samples with a hand auger from the earthen crawl space, the building perimeter, downgradient of the building, and upgradient near the access road. All soil samples were collected in accordance with **3e** SOP 2.1. The samples were then submitted for analysis of pesticides, herbicides, hexavalent chromium, and total TAL Metals by the following methods:

- ❖ Pesticides by EPA Method 8081B
- ❖ Herbicides by EPA Method 8151A
- ❖ TAL Metals by EPA Methods 6010C, 6020A, and 7471B
- ❖ Hexavalent Chromium by EPA Method 7196A

6.7.3. Results

The following **Table 6.7-1** presents a summary of the TAL Metals and Pesticide detections within this area defined as Finding #19.

Table 6.7-1 Summary of TAL Metals and Pesticide Detections at Finding #19

Notes:

Bold = Detection

Bold & Highlight = Detection Above Residential SSL

*EPA Residential Screening Levels, May 2018

A review of **Table 6.7-1** indicates that:

- ❖ Arsenic was detected at total concentrations exceeding the EPA Tier II SSL for unrestricted use; however, none of the detected concentrations exceeded the 12.41 mg/kg value for naturally occurring arsenic in the Piedmont physiographic province (explained in detail at **Section 8.1**).
- ❖ Hexavalent chromium in three (3) of the sample locations was detected at concentrations slightly above the EPA Tier II SSL of 0.3 mg/kg.
- ❖ Iron in three (3) of the sample locations was detected at concentrations above the EPA Tier II SSL of 55,000 mg/kg. The highest concentration was at sample 41 S-4, which was collected from the earthen floor crawl space. This area had numerous pieces of scrap corrugated roof material and other metallic debris, thus the iron concentration may be attributed to this debris.
- ❖ Lead was detected in all samples; however, elevated concentrations significantly exceeding the SSL of 400 mg/kg were detected in those samples near the building foundation and within the crawl space. It is likely that the deteriorated paint surface of the building is the primary source of this lead. The total concentrations observed may contain leachable lead concentrations that are characteristic of a hazardous waste. This hazardous/non-hazardous determination should be made prior to any soil excavation and disposal.

- ❖ Seven (7) of the eight (8) borings contained detections of pesticides, all of which have been banned from purchase since the late 1980s. Therefore, detections of these substances are likely from historic uses.
- ❖ Borings 41 S-4 and 41 S-5 contained the insecticide compound heptachlor and its daughter product heptachlor epoxide at concentrations exceeding their respective EPA Tier II SSLs. These detections indicate residual impact from storage, handling, and/or the reported spill of pesticides within the earthen floor crawl space of Building 41.

6.7.4. Recommendations

The shallow soil samples collected at Finding #19 contained detectable concentrations of hexavalent chromium, lead, and pesticides, many of which exceeded their respective Tier II SSLs. Based on this information, this area should be enrolled into the Virginia DEQ's VRP to obtain a Certification of Satisfactory Completion of Remediation. Additional information on the process and protections afforded by the VRP is included in **Section 8.2**.

The VRP process for this area would likely include the following general activities:

- ❖ Determine site eligibility and apply for enrollment into the VRP.
- ❖ Deconstruct/demolish Building 41 in a way to minimize disturbance of the earthen crawl space and soil proximate to the structure. An asbestos containing materials survey and demolition permit must be obtained prior to demolition.
- ❖ Perform in-situ waste characterization to determine proper disposal of soil to be excavated.
- ❖ Excavate all soil within and 5-ft beyond the footprint of Building 41 (total of approximately 2,000-ft²) after it has been demolished. Soil should be excavated to a minimum depth of 2-ft BGS. This would result in excavation of approximately 150 cubic yards (~230 tons) of soil.
- ❖ Collect samples after excavation of wastes to demonstrate removal of contaminants from the area. This data will also support the VRP quantitative risk assessment.
- ❖ Survey locate the bounds of the VRP Site.
- ❖ Heptachlor and the other detected pesticides are hydrophobic, indicating that impact to groundwater at this area is not likely. Additionally, depth to groundwater is greater than 15-ft BGS and future development should not encounter groundwater during excavation or construction activities. Therefore, groundwater characterization is not warranted at this time.

6.8. Finding #30: Gasoline UST and Diesel AST at Building 36

6.8.1. Background Summary

ECA Finding #30 was the current vehicle fueling area (Building 36) with the current 8,000-gallon gasoline UST. Two other proximate findings (#1 2,000-gallon diesel AST and #34 former 10,000-gallon gasoline UST) were also assessed under Finding #30.

6.8.2. Investigation Summary

Groundwater and soil were assessed in the 2017 Phase II ESA, which included the installation of five (5) soil borings with a GeoProbe direct-push rig and installation of two (2) monitoring wells into the permanent groundwater table using an air rotary rig. The location of these borings and monitoring wells are depicted on **Figure 30-1**. The soil samples collected at Finding #30 did not contain detectable petroleum impact; however, MW 30-1 contained low concentrations of TPH-GRO and methyl tertiary-butyl ether (MTBE), a fuel oxygenate. **3e** recommended that MW 30-1 be resampled to confirm the presence of these petroleum-indicator compounds.

As described in Task 2.6, the two (2) monitoring wells were resampled during this supplemental Phase II ESA. Because petroleum compounds were determined to be the likely contaminants, the following analyses were performed on the groundwater samples:

- ❖ TPH-GRO by EPA Method 8015C.
- ❖ TPH-DRO by EPA Method 8015C.
- ❖ VOCs by EPA Method 8260B.

6.8.3. Results

Both monitoring wells were purged and sampled using low-flow bladder pumps on September 28, 2018. The following **Table 6.8-1** summarizes groundwater parameters collected during the purge process method.

Table 6.8-1 Groundwater Purge Details at Finding #30

Notes:

* **Bold** indicates time of sample collection

A review of **Table 6.8-1** indicates that:

- ❖ An adequate purge was performed at each well, per **3e** SOP 2.7 and low-flow sampling guidance.
- ❖ Turbidity in monitoring wells 30-1 and 30-2 decreased significantly during the purge.

No petroleum indicator compounds or other VOCs were detected above laboratory LOQs in the 2018 groundwater samples. Therefore, both TPH-GRO and MTBE were absent from MW 30-1, as presented in the following **Table 6.8-2**. The detailed laboratory report in **Appendix E** includes LOQ, quality control, and quantitative results for all samples and analytes.

Table 6.8-2 Summary of Groundwater Detections at Finding #30

Well ID		MW 30-1		MW 30-2		EPA MCL*	
Lab ID		17J0020-02	18J0020-02	17J0020-01	18J0020-03		
Date Collected		10/2/2017	9/28/2018	10/2/2017	9/28/2018		
Analyte	CAS	Units	Result		Result		(mg/l)
Methyl-t-butyl ether (MTBE)	1634-04-4	mg/l	0.0264	< 0.001	< 0.001	< 0.001	--
TPH-GRO		mg/l	0.10	< 0.10	< 0.10	< 0.10	--

Notes:

Bold = Detection

*EPA Maximum Contaminant Level, May 2018

A review of **Table 6.8-2** indicates that dissolved-phase TPH-GRO and MTBE concentrations were not detected in MW 30-1 in 2018.

6.8.4. Recommendations

The 2017 Phase II ESA recommended that the monitoring wells at Finding #30 be resampled to confirm the low concentrations of TPH-GRO and MTBE in MW 30-1. Resampling has demonstrated that dissolved-phase petroleum impacts are not present above laboratory LOQs at Finding #30. No additional assessment or remedial actions are warranted at this time.

6.9. Findings #20 and #27: Bulk Pesticide and Oil Storage in Building 39

6.9.1. Background Summary

ECA Findings #20 and #27 were both within and proximate to Building 39, utilized by facility grounds maintenance for many decades (likely since at least the 1940s). An interior room within Building 39 was used by grounds maintenance to store and handle bulk pesticide containers. Several 55-gallon drums of used motor oil were located within Building 39, and smaller fuel containers were in a block structure just outside this building. Significant oil stains were observed on the earthen floor surrounding these drums and within the block structure.

Six (6) shallow soil borings (0-5-ft below ground surface) were advanced inside the earthen floor of Building 39 and immediately outside during the 2017 Phase II ESA (borings 39-1 through 39-6 on **Figure 20-1**). Results of soil samples confirmed residual petroleum impact from equipment maintenance and fuel/oil storage within the building and detected residual pesticide concentrations in excess of SSLs, including DDT, chlordane and heptachlor.

6.9.2. Investigation Summary

As described in [Task 2.9](#), this supplemental Phase II ESA expanded the investigation at Building 39 (Finding #20 and #27) to include groundwater assessment, define the horizontal and vertical extent of soil impacts beyond Building 39, and quantify impacts within the earthen floor of Building 39.

Due to the type confirmed impacts (metals, petroleum and pesticides), the following analyses were performed on the representative media samples:

- ❖ TPH-GRO, TPH-DRO and TPH-ORO by EPA Method 8015C: all soil and groundwater samples.
- ❖ Pesticides by EPA Method 8081B: all soil and groundwater samples.
- ❖ Herbicides by EPA Method 8151A: all soil and groundwater samples.
- ❖ VOCs by EPA Method 8260B: all groundwater samples
- ❖ TAL Metals by EPA Methods 6010C, 6020A and 7470A/7471B: all soil and groundwater samples.
- ❖ Hexavalent Chromium by EPA Method 7196A: all soil and groundwater samples.

6.9.2.1. Soil Borings

Delineation of the horizontal and vertical extent of soil impacts beyond Building 39 was performed through the advancement of six (6) soil borings with a GeoProbe direct-push rig in accordance with **3e** SOP 2.3 (see **Appendix A**). The location of these borings (39-21 through 39-26) are depicted on **Figure 3-1**.

Soil samples were collected from every 5-ft sleeve in each boring. Each boring was advanced to refusal, which was encountered between 5-ft and 14-ft BGS. Only one boring (39-25) contained a strong bitter odor near refusal at 14.5-ft, indicative of possible chemical impacts; however, VOCs were not detected with the photoionization detector (PID) during interval classification in the field.

6.9.2.2. Incremental Surface Soil Sampling – Within Building 39

Incremental sampling (IS) was performed as the most representative method to determine presence/absence of impacts to surface soil (0-6-inches BGS) within the earthen floor of Building 39. To perform IS, the Building 39 was first divided into six equal quadrants, and 10 aliquots of equal mass were collected and composited to form one IS from each quadrant. The locations of these quadrants are depicted as 39-A through 39-F on **Figure 3-1**.

6.9.2.3. Groundwater

Groundwater at Building 39 was assessed by the installation of three (3) monitoring wells into the permanent groundwater table using an air rotary rig in accordance with **3e** SOP 2.4 (see **Appendix A**).

6.9.3. Results

6.9.3.1. Soil Borings

The following **Table 6.9-1** presents a summary of the TAL Metals, petroleum, and detected pesticides.

 *EPA Residential Screening Levels, May 2018
 ** Value for Aromatic Low (C6-C8), most conservative value for TPH-GRO
 ***Value for Aliphatic Medium (C9-C18), representative of liquid fuels and appropriate for TPH-DRO

A review of **Table 6.9-1** indicates that:

- ❖ Arsenic was detected at total concentrations exceeding the EPA Tier II SSL for unrestricted use; however, none of the detected concentrations exceeded the 12.41 mg/kg value for naturally occurring arsenic in the Piedmont physiographic province (explained in detail at **Section 8.1**).
- ❖ Hexavalent chromium was not detected at concentrations above the EPA Tier II SSL of 0.3 mg/kg.
- ❖ Lead did not exceed the EPA Tier II SSL of 400 mg/kg.
- ❖ Only one (1) pesticide was detected in the soil borings (4,4'-DDE), in boring 39-22 0-5-ft BGS. This pesticide was not present above its SSL of 1.9 mg/kg.
- ❖ None of the TPH (GRO/DRO/ORO) exceeded their respective EPA Tier II SSLs.

6.9.3.2. Incremental Surface Sampling

The following **Table 6.9-2** presents a summary of the TAL Metals, petroleum, and detected pesticides

Table 6.9-2 Summary of Soil Sample Detections from Surface Soil within Building 39

Notes:

Bold = Detection

Bold & Highlight = Detection Above Residential SSL

*EPA Residential Screening Levels, May 2018

**Value for Aliphatic Medium (C9-C18), representative of liquid fuels and appropriate for TPH-DRO

A review of **Table 6.9-2** indicates that:

- ❖ Arsenic was detected at total concentrations exceeding the EPA Tier II SSL for unrestricted use, and two (2) exceeded the 12.41 mg/kg threshold for naturally occurring arsenic in the Piedmont physiographic province (explained in detail at **Section 8.1**).
- ❖ Hexavalent chromium in three (3) of the sample locations was detected at concentrations above the EPA Tier II SSL of 0.3 mg/kg.
- ❖ Lead was detected in all samples, and only one (1) was below the SSL of 400 mg/kg.
- ❖ The sodium concentration in 39-C was an order of magnitude higher than the other surface samples. This concentration is indicative of former road salt storage. There is no current SSL for sodium.
- ❖ All surface samples contained detections of pesticides, all of which have been banned from purchase since the late 1980s. None of the pesticides exceeded their respective SSLs. Chlordane and heptachlor (both present in the 2017 Phase II ESA) were not detected above their respective LOQs.

- ❖ TPH-DRO and TPH-ORO were detected at moderate concentrations indicative of surface spills, while TPH-DRO exceeded its SSL in every sample.

6.9.3.3. Groundwater

The three (3) monitoring wells installed to assess groundwater at Findings #20 and #27 were purged and sampled using low-flow bladder pumps on October 1, 2018. The following **Table 6.9-3** summarizes groundwater parameters collected during the purge process method. It was noted during purging that groundwater drawn from MW 39-1 and MW 39-3 exhibited a strong, stagnant odor.

Table 6.9-3 Groundwater Purge Details at Findings #20 and #27

Well ID	Date	Time*	Purge Volume (gallons)	Temperature (°C)	pH	Conductivity (mS/cm)	Turbidity (NTU)	Dissolved Oxygen (mg/L)	Oxidation-Reduction Potential (mV)
MW 39-1	10/1/2018	1137	0.0	23.00	6.37	11.9	>1000	8.46	207
		1140	0.1	18.94	5.59	12.5	>1000	6.91	251

1600	Sample	--	--	--	--	--	--	--	

Notes:

* **Bold** indicates time of sample collection

A review of **Table 6.9-3** indicates that:

- ❖ An adequate purge was performed at each well, per **3e** SOP 2.7 and low-flow sampling guidance.
- ❖ Turbidity in all monitoring wells decreased significantly during the purge.

Analytical results of samples collected from these five (5) monitoring wells indicated that low concentrations of barium were detected in all monitoring wells at Finding #16. The two polycyclic aromatic hydrocarbons (PAHs) detected at MW 16-2 in October 2017 were no longer present above the laboratory LOQ. These results are presented in the following **Table 6.9-4**. The detailed laboratory report in **Appendix E** includes LOQ, quality control, and quantitative results for all samples and analytes.

Table 6.9-4 Summary of Groundwater Detections at Findings #20 and #27

Well ID		MW 39-1	MW 39-2	MW 39-3	EPA MCL*	
Lab ID		18J0020-04	18J0020-05	18J0020-06		
Date Collected		10/1/2018	10/1/2018	10/1/2018		
Analyte	CAS	Units	Result	Result	Result	(mg/l)
TAL Metals - Total						
Aluminum	7429-90-5	mg/l	4.13	0.844	0.249	--

Zinc	7440-66-6	mg/l	0.0779	0.161	0.0526	--

Notes:

Bold = Detection

Highlight = Detection exceeds MCL

*EPA Maximum Contaminant Level, May 2018

A review of **Table 6.9-4** indicates that:

- ❖ Total cadmium was present in MW 39-1 and MW 39-2 slightly above its MCL of 0.005 mg/l.
- ❖ Hexavalent chromium was not detected in any of the monitoring well samples.
- ❖ Numerous other total TAL metals were detected at concentrations an order of magnitude less than their respective EPA Maximum Contaminant Level (MCL).
- ❖ Elevated sodium concentrations were detected in all three (3) monitoring wells. This may be the result of former road salt storage in the northeast corner of the building, as detected in the surface sample 39-C.
- ❖ No TPH or pesticides (primary contaminants of concern at Building 39) or daughter products were detected in the groundwater.

6.9.4. Recommendations

The shallow soil samples collected at Findings #20 and #27 (Building 39) during the 2017 Phase II ESA and this supplemental Phase II ESA confirmed heavy metal (arsenic, hexavalent chromium, and lead), petroleum, and pesticide impacts exceeded their respective Tier II SSLs within the earthen floor of Building 39. Based on this information, this area should be enrolled into the Virginia DEQ's VRP to obtain a Certification of Satisfactory Completion of Remediation. Additional information on the process and protections afforded by the VRP is included in **Section 8.2**.

The VRP process for this area would likely include the following general activities:

- ❖ Determine site eligibility and apply for enrollment into the VRP.
- ❖ Deconstruct/demolish Building 39 in a way to minimize disturbance of the earthen floor and soil proximate to the structure. An asbestos containing materials survey and demolition permit must be obtained prior to demolition.
- ❖ Perform in-situ waste characterization to determine proper disposal of soil to be excavated.
- ❖ Excavate all soil within and 5-ft beyond the footprint of Building 39 once it has been demolished. Soil should be excavated to a minimum depth of 2-ft BGS. This would result in excavation of approximately 230 cubic yards (350 tons) of soil.
- ❖ Collect samples after excavation of wastes to demonstrate removal of contaminants from the area. This data will also support the VRP required risk assessment.
- ❖ Survey locate the bounds of the VRP Site.
- ❖ If risk assessment activities identify the potential for impacts to sensitive receptors, then subdivide this area from the larger CVTC parcel, and record land use restrictions into the deed for this VRP Site.

7.0 ADDITIONAL CONSIDERATIONS

7.1. Land Disturbance and Demolition of Existing Structures

Prior to any land disturbance, including building demolition, the total amount (square footage) of disturbance must be calculated to determine applicability of an Erosion & Sediment Control Plan and Stormwater Pollution Prevention Plan.

- ❖ CVTC is located in an area of Amherst County not governed by the Chesapeake Bay Preservation Act. Therefore, an Erosion & Sediment Control Plan (ESC) will be required if total disturbance exceeds 10,000-ft².
- ❖ If total disturbance exceeds one (1) acre, then a Stormwater Pollution Prevention Plan (SWPPP) will be required in addition to the ESC Plan.
- ❖ If either of these plans are required, they must incorporate control of contaminants of concern in addition to traditional sediment and nutrient control.

Additionally, the following must occur prior to demolition of existing structures on state owned property:

- ❖ Obtain DGS permit for demolition of building on state property (DGS-30-176).
- ❖ The Virginia Department of Labor and Industry (DOLI) requires the acquisition of an Asbestos Removal and Demolition Permit before the demolition of a building or facility, even when no asbestos containing material (ACM) is present.

7.2. Asbestos Containing Materials

As referenced in **Section 7.1**, the Virginia DOLI demolition permit form combines the requirements of the National Emission Standards for Hazardous Air Pollutants (NESHAP), 40 CFR, Subpart M and the Virginia Department of Labor and Industry Regulation Concerning Licensed Asbestos Contractor Notification, Asbestos Project Permits, and Permits Fees (16VAC25-20). Both regulations require submittal of written notification before beginning renovation project, which include the disturbance of any asbestos-containing material (ACM) in a building or facility or before the demolition of a building or facility, even when no asbestos is present.

Therefore, an ACM survey will be required prior to demolition of any structure. Prior to performing an ACM survey, any and all information documenting the methods, results, conclusions, and recommendations of previously conducted ACM surveys should be made available and reviewed.

7.3. Lead Based Paint

Virginia DOLI Regulation Concerning Certified Lead Contractors Notification, Lead Project Permits and Permit Fees (16 VAC25-35) requires that written notification be submitted before beginning lead-based paint activities in target housing (built before 1978) and child-occupied facilities (e.g. day-care centers, preschools and kindergarten classrooms). Any existing structure to be renovated and used for housing or child-occupied space must meet these requirements.

Additionally, any lead-based paint assessment at CVTC should incorporate sampling of soil within the dripline of buildings. The dripline of some existing buildings has the potential to contain soil that is characteristic of a hazardous waste with respect to lead. This potential is based on TCLP leachable lead concentrations results associated with the spill cleanup at Building #45-5A (Finding #36) reported in the 2017 Phase II ESA **Section 6.17**, and concentrations detected at both Building 39 and 41 as reported in this supplemental Phase II ESA **Sections 6.7.3 and 6.9.3**.

7.4. Monitoring Well Abandonment

Any monitoring wells not incorporated into future characterization or monitoring activities should be abandoned in accordance with current Virginia Department of Health Private Well regulations governing observation, monitoring, and remediation wells (12VAC5-630-450).

8.0 CONCLUSIONS AND RECOMMENDATIONS

8.1. Naturally Occurring Arsenic in Soil

Total arsenic was ubiquitous in all soil analyzed across the CVTC campus at concentrations exceeding the risk-based EPA Region 3 Residential Soil Screening Level of 0.68 mg/kg. The arsenic concentration detected above this risk-based endpoint for unrestricted site use is likely to be naturally-occurring as detailed below.

To document the natural occurrence of arsenic, **3e** utilized the 2012 Draft Metals Background Document prepared by the DEQ, which compiled true background sample data from the VRP program to establish both mean concentrations and the upper prediction limit (UPC) at the 95-percent upper confidence interval (UCL) for the RCRA 8 metals within the Piedmont physiographic province of Virginia. A comparison of the data presented in the DEQ background metals study to the total arsenic concentrations detected at CVTC, indicates the following:

- ❖ The arsenic calculations were based on a set of 102 background samples
- ❖ The calculated mean background concentration of arsenic was 4.008 mg/kg within the Piedmont physiographic province
- ❖ The calculated UCL of background arsenic was concentrations 12.41 mg/kg within the Piedmont physiographic province.

- ❖ Therefore, any arsenic concentration at or below this 12.41 mg/kg UCL should be considered background (i.e. naturally occurring).

8.2. Virginia VRP

8.2.1. Purpose of VRP

The purpose of the VRP is to encourage the productive re-use of previously developed properties that may be environmentally impacted. The VRP program is a streamlined mechanism for site owners or operators to voluntarily address contamination at sites with concurrence from the Virginia DEQ.

When the remediation is satisfactorily completed, DEQ issues a "certification of satisfactory completion of remediation." This VRP certification provides assurance that the remediated site will not become the subject of a future DEQ enforcement action unless new issues are discovered. It is anticipated that the VRP will facilitate the sale and reuse of industrial and commercial properties in the Commonwealth, which is an important benefit to all Virginia residents.

As the potential environmental liabilities of reusing or further developing existing commercial properties diminishes, economic benefits are expected for both the buyer and seller. An added benefit is the decrease of expansion of commercial sites onto pristine lands. By overseeing the process, DEQ is able to ensure that the cleanup achieves a satisfactory level of human health and environmental protection.

8.2.2. Incorporation of CVTC Findings

At a minimum, the following findings assessed to date are recommended for an eligibility determination and subsequent application for enrollment into the Virginia VRP:

- ❖ Findings #3 and #9: Boiler House and Coal Ash Cleanup (**Section 6.1**)
- ❖ Finding #13: Closed Sanitary Landfill (**Section 6.2**)
- ❖ Finding #14: New Scrap Yard (**Section 6.4**)
- ❖ Finding #15: Coal Ash and Debris Dump (**Section 6.5**)
- ❖ Finding #16: Old Scrap Yard (**Section 6.6**)
- ❖ Finding #19: Pesticide and Lead impacts at Building 41 (**Section 6.7**)
- ❖ Findings #20 and #27: Bulk Pesticide and Oil Storage in Building 39 (**Section 6.9**)

Due to the VRP application process requirements and associated fees, it is suggested that all findings to date be recommended for enrollment into the VRP as one "Site," even if the Findings are physically separated across the CVTC property. Each finding can be surveyed and assessed independently, and land use restrictions, if required for one or more of the Findings, can be addressed under one VRP determination. This approach and corresponding conclusions will be

dependent on site-specific conditions, assessment/characterization data and associated risk assessments performed for each Finding as part of the VRP completion processes.

8.2.3. Available Funding Vehicles

Further assessment at CVTC is likely eligible for funding assistance, as it should meet the definition of a “brownfield site” under the 2002 Small Business Liability Relief and Brownfields Revitalization Act:

With certain legal exclusions and additions, the term "brownfield site" means real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties protects the environment, reduces blight, and takes development pressures off greenspaces and working lands.

Several funding mechanisms (including loans and grants) have been established by the Commonwealth of Virginia to assist with financing the assessment and remediation of impacted properties, as stated in the Code of Virginia §10.1-1231 (Brownfield restoration and land renewal policy and programs):

It shall be the policy of the Commonwealth to encourage remediation and restoration of brownfields by removing barriers and providing incentives and assistance whenever possible. The Department of Environmental Quality and the Economic Development Partnership and other appropriate agencies shall establish policies and programs to implement these policies, including a Voluntary Remediation Program, the Brownfields Restoration and Redevelopment Fund, and other measures as may be appropriate.

In addition to state-level funding opportunities, the federal EPA maintains a Brownfield grant program that provides direct funding for Brownfields assessment, cleanup, revolving loans, and environmental job training. To facilitate the leveraging of public resources, EPA's Brownfields Program collaborates with other EPA programs, other federal partners, and state agencies to identify and make available resources that can be used for Brownfields activities.

8.3. Additional Findings

The 2017 Phase II ESA and this supplemental Phase II ESA assessed those Findings classified as high and moderate risk to third party (offsite) receptors, human health and the environment. The remaining Findings presented in the July 2017 ECA will require assessment and/or management as part of facility closure; however, many of these Findings are associated with processes currently in use at CVTC (e.g. the 90,000-gallon heating oil AST at the boiler plant, USTs currently in use, etc.).

There will be future environmental management costs associated with these findings during facility closure, which should be assessed if/when the associated structures are demolished and/or removed from the site. For instance, a closure assessment will be required for all regulated petroleum storage tanks at CVTC, both above and underground. Such closures must comply with current above ground and underground storage tank regulations (9 VAC 25-91-10 et seq. and 9 VAC 25-580-10 et seq., respectively).

9.0 LIMITATIONS

It is impossible to know with certainty the entirety of a site is free of hazardous substances or conditions even with extensive subsurface testing. The conclusions of this investigation are based solely on the scope-of-work and on the sources of information reviewed during this investigation. This report was prepared for the exclusive use of DBHDS and their expressly-designated affiliates. **3e** accepts no responsibility for damages or claims resulting from past or future environmental degradation related to the subject property.

11.0 SIGNATURES OF ENVIRONMENTAL PROFESSIONALS

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312, and we have the specific qualifications based on education, training, and experience to assess the nature, history, and setting of the subject property. We have developed and performed all appropriate inquiries in general conformance with the standards and practices set forth in 40 CFR Part 312.

Table 1 - Summary of Findings

Finding #	Identity	Building #	Lat	Lon	Description	Source	REC Per ASTM E1527-13?	Recommendations & Notes
1	AST	36	37.41242	-79.1259	current 2,000-gallon diesel AST	Site visit	No	No evidence of staining around tank
2	AST	west of 31	37.4109	-79.124	1,000-gallon diesel AST in good condition, former tank from grounds crew building 37	Site visit, interview	No	No evidence of staining around tank
3	AST	77	37.41127	-79.1205	90,000-gallon #2 AST, formerly 100,000-gallon #6 AST with remote fill	Site visit, interview, FOIA	No	No evidence of staining around tank
4	AST	37	37.41094	-79.124	1,000-gallon diesel AST used to be located at grounds crew facility	Interview	De minimis	AST no longer present, moved and appears to be in good condition. No evidence of leaks or stains
5	Chemicals	46	37.41117	-79.1225	X-ray chemicals and other medically related interior storage	Site visit	No	Stored and used appropriately, no significant materials in lab
6	Chemicals	51	37.41245	-79.1256	Physical plant chemicals, all small containers	Site visit	No	All stored appropriately and no evidence of spills
7	Chemicals	56	37.41214	-79.1251	Screen building used to create vinyl signs and repair window screens, Small amounts of adhesives and paints	Site visit	No	
8	Chemicals	82	37.41194	-79.1254	Paint shop, some generation of hazardous wastes	Site visit	No	All stored appropriately and no evidence of spills. No floor drains present
9	COAL	77	37.41103	-79.121	Coal burning, ash, and accidental discharges to tributary via storm water inlets. Cleaned and ceased coal operations in 1999	FOIA	HREC	All coal ash and remaining coal were removed and excavated under DEQ supervision between 1996 and 1998. This includes around the boiler plant, and the rail siding unloading area to the southeast.
10	Historic Chemicals	47	37.40989	-79.1224	Location of former buildings & grounds, a building prior to 47	Historic Fire insurance maps, aerials, interviews	Yes	Use of paints, solvents, etc. prior to regulatory requirements for storage and disposal
11	Incinerator	13	37.41081	-79.1122	Former coal powered incinerator, used for sanitary and likely also medical waste	Site visit, interview, historic sources	Yes	Shallow soil samples for dioxins, dibenzofurans, PAHs and metals
12	Incinerator	west of 31	37.41057	-79.1237	Former medical waste incinerator, no longer operational	Site visit, interview, FOIA	Yes	Within the limits of the new scrapyard compound (see Finding 14)
13	Landfill	13	37.41097	-79.1109	~4-acre former sanitary landfill, operated since beginning of facility until approximately 1960s	Site visit, interview, historic sources	Yes	Delineate groundwater, secure cover, etc. and put through the VRP
14	Landfill	west of 31	37.40871	-79.1255	Landfill area, dubbed "New Scrap Yard"	Site visit, interview, historic sources	Yes	Delineate groundwater, secure cover, etc. and put through the VRP
15	Landfill	west of 83	37.40629	-79.122	Small landfilled area with construction debris and coal ash	Site visit, interview, historic sources	Yes	Delineate groundwater, secure cover, etc. and put through the VRP
16	Landfill	southwest of 83	37.4052	-79.1225	Large landfill area (6+ acres) dubbed "Old Scrap Yard." Asbestos tiles observed becoming exposed in forest floor, several mounds of discarded drums, etc.	Site visit, interview, historic sources	Yes	Delineate groundwater, secure cover, etc. and put through the VRP
17	LUST, UST	65	37.41312	-79.118	PC 1992-1677. 1,000-gallon gasoline UST removed, along with 26-tons of soil. 3/18/1992. no groundwater encountered above rock at 40.5-ft. All TPH less than 50 mg/kg in final soil samples	Interview, FOIA	HREC	Notation of prior work.
18	LUST, UST	46	37.41124	-79.1226	1,000-gallon diesel UST for backup generator, closed in place due to oxygen lines crossing tank. One sample was 112 mg/kg TPH-DRO, release reported and recorded as PC 2000-2032, but no requirements for follow-up. Appears duplicative of PC 1999-1203	Site visit, interview, FOIA	HREC	Note location of old UST (filled in place), remove UST if possible and perform proper closure assessment
19	Pesticide	41	37.41003	-79.1071	Spilled container of sulfur compound in crawl space, per Reve Carwile	Interview	Yes	segregate first foot of soil beneath building during demolition
20	Pesticide	39	37.41144	-79.1143	Pesticide storage, all bulk containers previously removed	Site visit, interview	Yes	segregate first foot of soil beneath building during demolition
21	PCBs	west of 31	37.40955	-79.1246	fence-enclosed area, formerly housed PCB containing transformers	Site visit, interview	Yes	Prior storage of PCB transformers pending final disposal considered an REC due to material threat of release of PCBs to surrounding ground surface
22	Septic	34-A	37.40862	-79.1053	Septic system for part time residence	Site visit, interview	No	
23	Septic	66	37.41151	-79.1269	Septic system for stock warehouse	Site visit, interview	No	No floor drains, system only for sanitary wastes

38	Oil drum	30	37.4104	-79.1225	One old Drydene oil drum (company out of business since 1991) and air compressors, suggesting compressor maintenance. 32 aw hydraulic oil	Site visit	Undetermined	Some evidence of minor spill, recommend characterization of contents to determine presence or absence of PCB's

July 2017 ECA

- 38 Environmentally Relevant Findings Identified at CVTC.
- 23 Findings Determined to be RECs.
- 23 RECs Categorized into High, Medium, and Low Priority Based on Risk

October 2017 Phase II ESA

- Triage Approach to Assessment
- Characterized 19 High and Medium Risk RECs
- Determined that No Further Action was Appropriate for 12 of the 19 RECs
- Recommended Additional Groundwater Sampling and Characterization of Landfill Areas

November 2018 Supplemental Phase II ESA

- Collected Additional Data at 9 RECs: 7 remaining from 2017 and 2 Additional Medium-Low Risk Sites
- Sampled all New and Existing Groundwater Monitoring Wells (9 Sites)
- Determined that No Further Action was Appropriate for 2 of the 9 RECs
- Recommend Enrolling CVTC into the DEQ's Voluntary Remediation Program to Remedy the 7 remaining RECs

Path Forward for Further Action

- Complete VRP Enrollment (December 2018)
- Establish Boundaries and Limits of Waste for all 4 Landfill Areas (January 2019)
- Collect Surface Soil Samples and Install Soil Gas Sample Points (January 2019)
- Complete Groundwater Monitoring Well Network at Landfill Areas (February 2019)
- Demolition of Buildings 39 and 41 Followed by Shallow Soil Excavation (April 2019)
- Limited Removal Action of Surficial Debris and Apply Additional Cap Material to Landfill Areas as Needed (late 2019)

Certificate of Satisfactory Completion (mid 2020)

Appendix A: Standard Operating Procedures

1.0 CONTAMINATION PREVENTION

1.1. Decontamination and Cross-Contamination Prevention

The following procedures shall be implemented to ensure sample collection and other related equipment is properly decontaminated to prevent possible cross-contamination of samples. It is imperative that equipment be properly decontaminated and measures be implemented to prevent cross-contamination of field/sample collection equipment and actual samples that are collected.

1. All work should proceed from areas of suspected or known low contamination to areas of suspected or known high contamination.
2. All heavy equipment (e.g., drill rigs, Geoprobe™ units, backhoes, etc.) shall be decontaminated prior to coming on-site for work and all down-hole drilling equipment (e.g., auger flights, drilling rods, split spoons, etc.) shall be decontaminated between each drilling/sampling location.
 - a. A decontamination station/pad shall be established for cleaning down-hole equipment. Decontamination wastes shall be contained and collected for disposal.
 - b. Large equipment (e.g., augers, drilling rods) shall be decontaminated using a steam cleaner or equivalent, while use of a detergent solution may be appropriate for smaller pieces of equipment (e.g., split spoons).
3. All equipment utilized in water level measurement, sample collection, or that otherwise contacts material to be sampled will be decontaminated between each location and prior to returning to its case and being stowed with other equipment.
 - a. Personnel involved with equipment decontamination shall wear clean gloves during the decontamination process.
 - b. Cleaning shall be performed using a detergent solution (e.g., Alconox) with a distilled water rinse. If equipment has contacted free product, the decontamination process shall include an isopropyl alcohol rinse. All wash/rinse activities shall be performed in buckets or other suitable containers. Used water should be contained in 55-gallon drums for disposal (SOP 1.2) or disposed on-site in accordance with Virginia Department of Environmental Quality Guidelines if deemed appropriate.*
 - c. Reusable sampling equipment that has been cleaned for later use (e.g., steel trowels, hand auger buckets, etc.) shall be wrapped in clean aluminum foil, sealed in plastic bags, or similarly isolated from potential contamination until used.
4. Field Personnel shall use clean gloves when handling any sampling equipment and shall avoid contacting sampling equipment with other potentially contaminated surfaces/materials. New gloves shall be used whenever a new sample is collected or when a break in sampling occurs (e.g. between well purging and sampling).

5. Investigation derived waste (IDW) and other trash and debris shall be staged away from sampling equipment and other materials to avoid potential cross-contamination.
6. Trip blanks should be sent in any cooler where significant volatile organic compound (VOC) contamination is suspected.

* Purged, petroleum contaminated groundwater and other rinsewater from routine sampling/monitoring activities may be discharged back to the area of contamination with certain restrictions (Storage Tank Program Technical Manual).

1.2. Disposal of Investigation Derived Waste

The following activities shall be completed upon completion of fieldwork:

1. All field equipment, instruments, buckets, etc. shall be thoroughly cleaned/ decontaminated per Standard Operating Procedure 1.1 prior to leaving the site.
2. All Investigation Derived Waste (IDW) including purge water, excess soil cuttings, etc. that may be contaminated must be properly contained, labeled and disposed. IDW is and will remain the property of the facility Owner although the Client may pay to dispose of this material as part of its access agreement with a third-party property owner.*
 - a. Use on-site disposal (roll-off container, etc.) for IDW if approved by property owner and appropriate for the type of waste generated, if approved by property owner and Client.
 - b. Provide drums to stage IDW for disposal. Drum staging must be coordinated with the property owner and Client.
3. Any ancillary IDW materials (such as used bailers, gloves, used sample containers, etc.) that may be disposed as solid sanitary waste (e.g. trash) should be properly disposed as such into a proper waste container.
4. Unused equipment may be shipped back to the supplier, as appropriate, or stored for future use.
5. The Client and its consultant shall define responsibility for IDW disposal as part of site specific scopes of work.
6. All IDW will be handled by and disposed in accordance with applicable federal state and local regulations at an appropriately permitted treatment or disposal facility.

* Purged, petroleum contaminated groundwater and other rinsewater from routine sampling/monitoring activities may be discharged back to the area of contamination with certain restrictions (Storage Tank Program Technical Manual).

2.0 SAMPLING PROTOCOL

2.1. Surface and Shallow Soil Sample Collection

Surface and shallow soil samples can be collected to evaluate surface conditions and to characterize shallow soil profiles.

Surface soil samples are typically collected using stainless steel trowels, spoons, or scoops using the following procedure:

1. A decontaminated trowel, spoon, or scoop is used to remove grass, gravel, or other surface cover in the area to be sampled.
2. The underlying soil material is then collected and placed into a decontaminated bowl or directly into the sample container using a second decontaminated trowel, spoon, or scoop.
 - a. For volatile analysis, soil is collected using specially designed equipment (e.g., EPA Method 5035) to minimize the loss of volatile constituents.
 - b. For non-volatile analysis, soil may be placed into a bowl, then mixed and sieved to assure that a homogenous sample free of rocks and debris is delivered to the laboratory for analysis. Once the soil is properly mixed and sieved (if appropriate), it is then placed into the appropriate sample container(s).
3. The steel trowels, spoons, or scoops are decontaminated between each sampling location.

Hand augers can be used to collect shallow soil samples in an effort to characterize shallow soil strata, determine presence of organic vapors, and obtain soil samples for subsequent laboratory analysis. The hand auger method is typically used as a screening method and can provide preliminary indication of stratigraphy and the presence of contaminants in shallow soils. Where more rigorous sampling methods or deeper samples are required, other methods (such as hollow-stem auger borings) are employed.

A hand-auger borehole is advanced by pushing and turning the auger assembly (handle, extension rods and bucket) and retrieving collected soil from the auger bucket. Samples collected from hand auger borings are considered "disturbed" samples.

The following procedure is typically used in collecting soil samples using a hand auger:

1. A decontaminated hand auger assembly (handle, extensions and auger head or bucket) is manually advanced to the desired sampling depth by turning clockwise and pushing downward on the assembly handle.
2. After the auger head is filled with soil, the assembly is pulled from the subsurface, and the contents are removed by either turning the assembly upside-down or by inserting a hand

tool such as a decontaminated stainless steel spoon, trowel, etc. This process continues until the boring is terminated or the collection of a sample for laboratory analysis is desired.

3. Samples for laboratory analysis are collected using a decontaminated auger head. The soil sample is collected directly from the auger head or by the use of decontaminated hand tools depending on soil consistency.
 - a. For volatile analysis, soil is collected from the auger head utilizing EPA Method 5035 to minimize the loss of volatile constituents.
 - b. For non-volatile analysis, soil may be placed into a bowl, then mixed and sieved (if appropriate) to assure that a homogenous sample free of rocks and debris is delivered to the laboratory for analysis. Once the soil is mixed it is then placed into the appropriate sample container(s).
4. Abandonment of the boring entails backfilling with auger cuttings (if allowed), or chipped bentonite or grout if the boring is terminated below the water table.
5. The steel auger head, as well as the extension rods and handle, are decontaminated prior to the start of each hand-auger boring.

2.2. Hollow Stem Auger Drilling and Soil Profiling/Sampling

Hollow-stem auger borings can be used to characterize soil profiles, determine the presence of organic vapors, and to obtain soil samples for subsequent laboratory analysis. Hollow-stem auger borings can also be the first step in the process of installing a groundwater-monitoring well. (Refer to appropriate standard procedures for well installation.)

1. Decontaminate all down-hole drilling/sampling equipment prior to the start of work and between drilling/sampling locations (i.e. between each boring for augers and between each sample location for splits spoons and other sampling equipment).
2. Advance augers to desired depth using continuous flight, hollow-stem augers attached to a truck, trailer, or ATV-mounted drilling rig.
3. Soil samples are collected at regular intervals, as required by the Sampling and Analysis Plan, by advancing the augers to a depth just above the desired sampling zone. (Typically, a five-foot sample interval is used.) A decontaminated split-spoon sampler is attached to the drill rod and lowered through the center of the augers and driven into the soil with a 140-pound hammer according to ASTM D-1586. The split-spoon is retrieved and opened to reveal the semi-undisturbed soil sample. The following information is recorded on the *Boring Log* maintained for each boring (see attached example of an appropriate boring log form in Appendix B):
 - a. Standard Penetration Test (SPT) results (i.e. the number of hammer blows per each six-inch increment of the 18-inch to 24-inch split-spoon penetration or fraction thereof).
 - b. The soil type classified according to the Unified Soil Classification System (USCS) Visual-Manual Procedure (ASTM D-2488) or other recognized method (e.g., USDA soil triangle).
 - c. Other pertinent comments, including color, odor, and moisture content.
4. Collect samples from each split spoon for organic vapor [total volatile organic compounds (VOCs)] using the following procedure:
 - a. Place an aliquot of the soil sample in a clean, airtight container (either sealed Zip-Lock[®] bag, sealed glass jar, or plastic container) as quickly as possible after sample collection.
 - b. Label the container with boring number and sample depth.
 - c. Allow the samples to sit for approximately 15 minutes to allow the VOC concentration to equilibrate between the soil and air in the container headspace.
 - d. A flame ionization detector (FID) or photo-ionization detector (PID) instrument probe is then inserted into the container to measure the headspace VOC concentration (read directly from the read-out display in parts-per-million (ppm) of total VOCs). The container is opened enough to insert the probe but no further to prevent loss of VOC constituents to the atmosphere.
 - e. VOC concentration is recorded on the boring log/field notes.

5. Collect samples for laboratory analysis, as needed based upon the project requirements, using the following procedure:
 - a. Potential laboratory samples are placed into the appropriate sample container(s) required for the specific analyses to be performed immediately after the samples are retrieved.
 - b. Select samples to be submitted to the laboratory based upon organic vapor screening, visual observations, project Sampling and Analysis Plan, etc.
 - c. Handle samples in accordance with standard sample handling, shipping, and chain-of-custody practices as presented in the project Quality Assurance Project Plan and Sampling and Analysis Plan.
6. Upon boring termination at the desired depth or auger refusal (bedrock), the boring is ready for monitor well installation or will be advanced deeper by using other drilling techniques. If the boring is to be abandoned, it must be abandoned in accordance with 12VAC 5-630-450(C)(8). This typically includes sealing the borehole with bentonite grout if terminated below the water table. Otherwise, the boring is backfilled with auger cuttings, natural material, or bentonite.
7. Upon completion of work, any excess soil that cannot be used as backfill in the core holes must be properly managed. Management of this material shall be as directed by the consultants Technical Lead/Project Manager and Client in accordance with Standard Operating Procedure 1.2.

2.3. Direct Push Borings and Soil Profiling/Sampling

Direct push (e.g., Geoprobe™) equipment may be utilized as an alternative to hollow-stem auger borings to characterize soil profiles, determine the presence of organic vapors, and obtain soil samples for subsequent laboratory analysis. Direct push equipment can also be used to collect groundwater samples and/or to install small diameter piezometers/monitoring wells.

1. Decontaminate all down-hole coring/sampling equipment prior to start of work and between locations (i.e., between each boring for push rods and between each use for samplers).
2. Advance direct push soil coring equipment using truck or ATV-mounted direct push equipment. Coring equipment is advanced using a hydraulic hammer and the weight of the direct push rig.
3. Depending on equipment used, either collect continuous soil cores or advance sampler to specific interval to collect soil core(s) based on the Sampling and Analysis Plan. A precleaned, disposable acetate sleeve is placed into the core sampler, which is advanced continuously or advanced and opened at the desired interval depending on the equipment used. The sample is retrieved and the acetate sleeve containing the soil core is removed. The sleeve is opened to reveal the semi-undisturbed soil sample. The following information is recorded on the *Test Boring Log* maintained for each boring (see attached example of an appropriate boring log form in Appendix B):
 - a. The soil type classified according to the Unified Soil Classification System (USCS) Visual-Manual Procedure (ASTM D-2488) or other recognized method (e.g., USDA soil triangle).
 - b. Other pertinent comments including color, odor, moisture content, type and size of rock fragments (if present), and presence of fill materials.
4. Collect sample from each soil core for organic vapor [total volatile organic compounds (VOCs)] screening using the following procedure:
 - a. Place an aliquot of the soil sample in a clean, airtight container (either sealed Zip-Lock® bag, sealed glass jar, or plastic container) as quickly as possible after sample collection.
 - b. Label container with boring number and sample depth.
 - c. Allow samples to sit for approximately 15 minutes to allow for VOC concentration to equilibrate between the soil and the air in the container headspace.
 - d. A flame ionization detector (FID) or photo-ionization detector (PID) instrument probe is then inserted into the container to measure the headspace VOC concentration. (Read the concentration directly from the read-out display in parts-per-million (ppm) of total VOCs.) The container is opened only enough to insert the probe to prevent loss of VOCs to the atmosphere.
 - e. VOC concentration is recorded on the boring log/field notes.

5. Collect samples for laboratory analysis, as needed based upon the project requirements, using the following procedure:
 - a. Potential laboratory samples are placed into the appropriate sample container(s) required for the specific analyses to be performed immediately after the sample is retrieved.
 - b. Select samples to be submitted to the laboratory based upon organic vapor screening, visual observations, etc.
 - c. Handle samples in accordance with standard sample handling, shipping, and chain-of-custody practices (Standard Operating Procedure 2.9).
6. The core hole is abandoned upon coring termination at the desired depth or at direct push refusal. The core hole is filled with bentonite pellets if terminated below the water table. Otherwise, the core hole is filled with recovered core material, natural on-site material, or bentonite pellets.
7. Groundwater samples may be collected from the corehole using a specialized, sealed, discrete interval groundwater sampler such as the Geoprobe™ Screen Point 15 Groundwater Sampler. A sampler with a stainless steel screen is preferred for decontamination purposes. Samples are collected as follows:
 - a. Advance decontaminated sampler on pushrods to desired depth.
 - b. Retract outer sleeve of sampler to expose screen and allow groundwater to enter sampler.
 - c. Use peristaltic pump with precleaned, disposable tubing or small diameter bailer to extract groundwater from the sampler in accordance with Standard Operating Procedure 2.6 or 2.7. (Note: when a sample is collected immediately from such a sampler, there is no stagnant water to be purged. However, standard purging methods should be used when groundwater recharge rates allow to ensure a representative sample is collected. Recharge into the sampler may be slow, particularly in formations with low-permeability, and care should be taken to properly purge the well while allowing for adequate recharge for representative sample collection. If the sampler is left in the formation for greater than 24-hours, the well must be properly purged to remove the stagnant water.)
 - d. Discharge groundwater into the appropriate sample container(s) required for the specific analyses to be performed immediately after the sample is retrieved.
 - e. Handle samples in accordance with standard sample handling, shipping, and chain-of-custody practices as outlined in the Quality Assurance Project Plan.
8. Small diameter piezometers/monitoring wells may be installed in the core hole upon removal of the coring equipment. Screen and casing pipe are lowered into the hole, and the piezometer/monitoring well is constructed following standard practices as described in Standard Operating Procedure 2.4.
9. Upon completion of work, any excess soil that cannot be used as backfill in the core holes must be properly managed. Management of this material shall be as directed by the

consultant's Technical Lead/Project Manager and Client in accordance with Standard Operating Procedure 1.2.

2.4. Shallow Monitoring Well and Piezometer Installation

Shallow monitoring wells and piezometers are installed in unconsolidated material to provide secure sampling points for the uppermost zones of water table (unconfined) aquifers.

Following boring termination (typically borings advanced using hollow-stem augers), the well is constructed. Typically, the well is built within the hollow stem of the augers as this method allows for protection of the well screen against collapse of the borehole before the well filter pack is properly emplaced. The auger flights may be removed from the ground prior to well construction if there is reason to believe that the borehole will not collapse. If a well is constructed within a borehole advanced using air rotary drilling or direct push technology, the drilling equipment must be removed prior to well construction.

The following procedure is used for well construction:

1. Clean, flush-threaded well casing with factory-slotted well screen (typically Schedule 40 polyvinyl chloride (PVC)) is lowered into the borehole. Compatibility of screen material and slot size with site conditions must be considered. Stainless steel well screen may be needed at extremely contaminated sites.
2. Filter sand is then gravity-fed into the annulus between the well screen and the inside of the augers as the augers are slowly pulled from the borehole (or between the well screen and the boring walls if the drilling equipment has been removed). Filter sand is added to a height of approximately one to two feet above the top of the screen.
3. A bentonite seal is emplaced above the sand filter pack (approximately one to two feet thick) to prevent vertical movement of groundwater within the borehole (i.e., to prevent cross contamination from upper to lower zones). Bentonite pellets are placed into the annular space above the sand filter pack and then hydrated with distilled water to create a low permeability barrier.
4. A neat cement grout is then tremied (gravity-fed, if the bentonite seal is within a few feet of the surface) into the remaining annulus to ground surface.
5. The uppermost portion of each well is constructed to protect the well casing from damage.
 - a. The protective cover may be finished above grade with a steel protective outer casing with locking cover. A slip cap is typically placed over the well casing to prevent dirt and debris from entering the well.
 - b. The protective cover may be finished at grade with a steel man way with a bolt-down cover. A locking, watertight expanding cap is placed on the well to prevent dirt, debris, and water from entering the well.
6. The following information is recorded to complete the *Boring Log/Well Completion Record* (see attached example of an appropriate well completion record form in Appendix B):

- a. Depth of borehole
 - b. Length of screen pipe and actual screened interval
 - c. Length of casing pipe
 - d. Screen slot size
7. The top of casing (TOC) of the wells is surveyed for horizontal and vertical control for use in evaluating hydraulic gradients.
 8. Wells should be labeled when constructed (metal tags in or on well protective casing). A description of the well location should be included in the field notes.
 9. If the well is to be used as a temporary (one-time) sampling point, neat cement grout is not placed above the bentonite seal. After sampling, the temporary well can be abandoned by either pulling the casing and screen then filling the borehole with cement grout, or by leaving the casing in place and filling the casing and annular space above the bentonite seal with cement grout.
 10. Piezometers are installed when there is only a need to measure liquid levels (rather than collecting actual groundwater samples). Piezometers are typically constructed with small diameter (1-inch) casing.
 11. Prior to sampling, monitoring wells are developed to reduce the amount of sediment in well annular space. This enhances the flow of groundwater from the formation into the well and helps to ensure that the samples collected are representative of the quality of water in the aquifer. The well may be developed using a bailer or small pump as follows:
 - a. A disposable bailer or decontaminated pump is lowered into the well and allowed to sink to the bottom of the well casing.
 - b. If the well is developed by manual bailing, the bailer is raised using periodic, sharp upward tugs (surges). The surging motion of the bailer causes water to be extracted from the formation, through the screen filter pack into the screen. This also causes fine material that may have been mixed into the filter pack during installation to become suspended in the well water so that it can be removed via bailing.
 - c. If the well is developed using a pump, the pump must be periodically raised with sharp tugs (surges) to facilitate the removal of sediment from the filter pack and well casing.
 - d. Well development continues with water removal and periodic surging until the bailed water becomes as clear as practical.
 - e. In some cases, the well will go dry before the "clear water" endpoint is reached. If this happens, the well should be given time to recharge and the process repeated. If, after several such attempts, the well water remains turbid, the development process can cease. It is possible that, in certain low-yielding geologic units, a well cannot be developed to the clear water condition in a practical length of time. The endpoint for well development should be coordinated with the Technical Lead/Project Manager.

12. Well Abandonment - when a decision is made to abandon a monitoring well, the borehole should be sealed in such a manner that the well can not act as a conduit for migration of contaminants from the ground surface to the water table or between aquifers. To properly abandon a well, the preferred method is to completely remove the well casing and screen from the borehole, clean out the borehole, and backfill with a cement or bentonite grout, neat cement, or concrete.
 - a. As previously stated the preferred method should be to completely remove the well casing and screen from the borehole. For shallow wells this can be accomplished by attaching a drilling rig cable tool to the casing and slowly pulling the casing from the well.
 - i. The clean borehole can then be backfilled with the appropriate bentonite grout material. The backfill material should be placed into the borehole from the bottom to the top by pressure grouting with the positive displacement method (tremie method).
 - ii. The top 2 feet of the borehole should be poured with concrete to insure a secure surface seal (plug).
 - b. If the casing cannot be readily removed the well can be grouted with the casing left in the borehole. The preferred method in this case is as follows:
 - i. Pressure grout the borehole by placing the tremie tube to the bottom of the well casing, which will be the well screen or the bottom sump area below the well screen.
 - ii. The pressurized grout is forced out through the well screen into the filter material and up the inside of the well casing sealing holes and breaks that are present.
 - iii. The tremie tube is retracted slowly as the grout fills the casing.
 - iv. The well casing is cut off even with the ground surface and filled with concrete to a depth of 2 feet below the surface. If the casing has been broken off below the surface, the grout should be tremied to within 2 feet of the surface and then finished to the ground surface with concrete.
 - c. If geologic conditions warrant the complete removal of the well casing, sand pack and other well construction materials, the well must then be over drilled and grouted. After the casing materials have been removed from the borehole, the borehole should be cleaned out and pressure grouted with the approved grouting materials. As previously stated, the borehole should be finished with a concrete surface plug.
13. Temporary Monitoring Well Types - five types of monitoring wells which have been shown to be acceptable are presented in the order of increasing difficulty to install and increasing cost:
 - a. No Filter Pack - this is the most common temporary well and is very effective in many situations. After the borehole is completed, the casing and screen are simply

inserted. This is the most inexpensive and fastest well to install. This type well is extremely sensitive to turbidity fluctuations, because there is no filter pack. Care should be taken to not disturb the casing during purging and sampling.

- b. Inner Filter Pack - this type differs from the "No Pack" only in that a filter pack is placed inside the screen to a level approximately 6 inches above the well screen. This ensures that all water within the casing has passed through the filter pack. For this type well to function properly, the static water level must be 6-12 inches above the filter pack.
- c. Traditional Filter Pack - for this type, the screen and casing are inserted into the borehole, and the sand is poured into the annular space surrounding the screen and casing. Occasionally, it may be difficult to effectively place a filter pack around shallow open boreholes, due to collapse. This method requires more sand than the "inner filter pack" well, increasing material costs. As the filter pack is placed, it mixes with the muddy water in the borehole, which may increase the amount of time needed to purge the well to an acceptable level of turbidity.
- d. Double Filter Pack - the borehole is advanced to the desired depth. As with the "inner filter pack" the well screen is filled with filter pack material and the well screen and casing inserted until the top of the filter pack is at least 6 inches below the water table. Filter pack material is poured into the annular space around the well screen. This type temporary well construction can be very effective in aquifers where fine silts or clays predominate. This construction technique takes longer to implement and uses more filter pack material than others previously discussed.
- e. Well-in-a-Well - the borehole is advanced to the desired depth. At this point, a 1-inch well screen and sufficient riser is inserted into a 2-inch well screen with sufficient riser, and centered. Filter pack material is then placed into the annular space surrounding the 1-inch well screen, to approximately 6 inches above the screen. The well is then inserted into the borehole. This system requires twice as much well screen and casing, with subsequent increase in material cost. The increased amount of well construction materials results in a corresponding increase in decontamination time and costs. If pre-packed wells are used, a higher degree of QA/QC will result in higher overall cost.

2.5. Liquid Level Measurement

Liquid levels (depth to groundwater and free product, as applicable) in groundwater monitoring wells and piezometers are measured (gauged) using an electronic water level indicator or oil/water interface probe as appropriate based on site conditions. Specific steps in the measurement process are as listed below.

Note: Liquid levels shall be measured in all wells prior to sampling so that the measurements are collected over the shortest time period possible. If all wells can be sampled within one day, the groundwater level measurements may be obtained for each well as it is sampled.

1. Remove protective covers, locks, and well caps from all wells to be gauged, and allow the groundwater to equilibrate to atmospheric pressure. Note if any wells are under pressure, under vacuum, or have an odor. Screen well casing for organic vapors using a photoionization detector (PID) or flame ionization detector (FID) if required by the project. Record pertinent observations/measurements in field notes.
2. If the well cap, lock, etc. is damaged or missing, document the condition in the field notes, and replace the material as needed.
3. If a dedicated bailer is contained/stored in the well, remove it, and place it on clean plastic sheeting or aluminum foil to prevent field contamination.
4. Measure liquid levels starting at the background or least impacted well(s) and moving to the most impacted wells.
 - a. Measure depth to groundwater and depth to free product, as appropriate, from the surveyed control point on well top of casing.
 - b. Record measurements in the field notes along with any pertinent comments.
5. Decontaminate the water level indicator and/or oil/water interface probe before use, between each well, and upon completion of measurements.
 - a. Rinse probe and tape with soap solution followed by a distilled water rinse.
 - b. Wash portions exposed to free product with isopropyl alcohol followed by a distilled water rinse.
6. Replace well caps, locks, and bailers, if necessary, and replace protective cover.

Note: High viscosity (thick) oil tends to stick to the oil/water interface probe and can result in exaggerated measurements of free product thickness. To minimize this effect, lower the oil/water interface probe until the probe signals water. Then, slowly raise the probe until the presence of oil is indicated. Record the second measurement as the depth to water in the well. If measurement with the oil/water interface probe is not effective, a bailer may be lowered into the well and the free product thickness in the bailer can then be measured.

2.6. Monitoring Well Sampling Using a Bailer

Bailers can be used to manually collect representative groundwater samples from relatively shallow, small-diameter wells (i.e., 6-inch diameter or smaller). A dedicated Teflon® bailer, decontaminated Teflon® bailer, or disposable polyethylene bailer is used with new nylon cord/rope to purge and then sample the well. Specific steps in the sampling process are as follows:

1. Remove the well cover, lock, and well cap.
2. Record the Photoionization Detector (PID) reading in the well casing as necessary based on project requirements.
3. Make sure all equipment has been thoroughly decontaminated before use.
4. Gauge the depth to water from the top of casing (TOC) mark on the well casing using an electronic water level indicator or oil water interface probe.
5. Using the depth to water measurement, total depth of the well, and well diameter, calculate the required purge volume. (Conversion factors for water column height to volume are as follows: 0.16 gallons per foot for a 2-inch well and 0.61 gallons per foot for a 4-inch well). Record the absence or presence of free phase petroleum hydrocarbons (or free product). The calculation of the required purge volume is as follows:
 - a. Volume of water in well (gallons) = (Total Depth of Well – Depth to Water) * Conversion Factor
 - b. Total Purge Volume (gallons) = 3 * Volume of water in well
6. Water is removed (purged) from the well before sampling in order to remove stagnant water in the well column and to allow "fresh" or representative formation water to enter the well screen.
 - a. Gently lower the bailer to the bottom of well with cord/rope and remove accumulated groundwater.
 - b. Continue the purge process until at least three well volumes have been removed or the well is bailed dry. To determine the volume purged, estimate approximately 0.25 gallons (or 1 liter) as the volume of a 36-inch bailer, or use a graduated bucket.
 - c. A representative water sample shall be collected at a minimum frequency of once after each well volume is purged. These samples shall be checked in the field to assure that the water quality parameters (pH, temperature, and specific conductance) have stabilized (i.e., readings are within 10% of the previous measurement). If water quality parameters have not stabilized, the purge process is continued. The groundwater purge measurements shall be recorded in the field notes or on a separate *Groundwater Purge Data* form (see attached example of an appropriate boring log form in Appendix B).
 - d. Upon completion of purging and prior to sampling, the bailer and cord/rope shall be tied off inside the well casing or removed from the well and placed on clean

- plastic sheeting or aluminum foil to prevent field contamination of the sampling equipment.
- e. Purge water shall be collected and managed as directed by the Technical Lead/Project Manager. In certain circumstances, it may be permissible to discharge purge water to the ground surface if approved by the regulatory agency coordinating the work.
7. Upon satisfactory completion of well purging, groundwater samples are collected for analysis.
- a. Groundwater sampling is performed within 24 hours of purging to minimize the loss of any volatile compounds present (unless insufficient water has re-entered the well).
 - b. The bailer is lowered gently below the water surface (until completely submerged, if possible). It is then retrieved, and the water is gently poured into the appropriate sample containers.
 - c. The sample containers are labeled with well number, date, time, and analysis to be conducted. Samples are collected and contained in order of volatilization sensitivity. The preferred collection order for some common groundwater parameters is as follows:
 - i. Volatile organics
 - ii. Total organic carbon
 - iii. Total petroleum hydrocarbons
 - iv. Semi-volatile organics
 - v. Total metals
 - vi. Phenols
 - vii. Sulfate and chloride
 - viii. Nitrate and ammonia
 - d. All samples are logged on a chain-of-custody form and immediately stored in an ice-filled cooler (maintaining a temperature of approximately 4°C). Samples are transported to the laboratory under EPA approved chain-of-custody procedures.

2.7. Monitoring Well Sampling Using a Pump

Various types of pumps can be used to collect representative groundwater samples from monitoring wells. For the purposes of assessment work performed, it is expected that dedicated groundwater pumps will not typically be installed as it is most likely that Client funds will be used for initial investigations and not long-term monitoring. However, there are times when collecting samples using decontaminated pumps may be applicable, such as collection of samples from deep wells or when low-flow sampling is desired to reduce sample turbidity or potential loss of volatile constituents. Such pumps shall be primarily of stainless steel and Teflon[®] construction (components that will be in contact with the water) for ease of decontamination between locations. Disposable polyethylene or similar inert tubing is used to convey the groundwater to the surface. Specific steps in the sampling process are as follows:

1. Remove the well cover, lock, and well cap.
2. Record the Photoionization Detector (PID) reading in the well casing as necessary based on project requirements.
3. Make sure all equipment has been thoroughly decontaminated before use.
4. Gauge the depth to water from the top of casing (TOC) mark on the well casing using an electronic water level indicator or oil water interface probe.
5. Using the depth to water measurement, total depth of the well, and well diameter, calculate the required purge volume. (Conversion factors for water column height to volume are as follows: 0.16 gallons per foot for a 2-inch well and 0.61 gallons per foot for a 4-inch well). Record the absence or presence of free phase petroleum hydrocarbons (or free product). The calculation of the required purge volume is as follows:
 - a. Volume of water in well (gallons) = (Total Depth of Well – Depth to Water) * Conversion Factor
 - b. Total Purge Volume (gallons) = 3 * Volume of water in well
6. Purging with Pumps –
 - a. When peristaltic pumps or centrifugal pumps are used, only the intake line is placed into the water column.
 - b. When submersible pumps (bladder, turbine, displacement, etc.) are used, the pump itself is lowered into the water column. The pump must be decontaminated prior to use.
 - c. Purging Entire Water Column - the pump/hose assembly used in purging should be lowered into the top of the standing water column and not deep into the column. This is done so that the purging will "pull" water from the formation into the screened area of the well and up through the casing so that the entire static volume can be removed. If the pump is placed deep into the water column, the water above the pump may not be removed, and the subsequent samples, particularly if collected with a bailer, may not be representative of the ground water. (For wells with a low

recharge rate it may be necessary to gradually lower the pump/intake line into the well as the water level drops.) (Careful consideration shall be given to using pumps to purge wells which are excessively contaminated with oily compounds, because it may be difficult to adequately decontaminate severely contaminated pumps under field conditions.)

- d. Low Flow/Low Volume Purging Techniques/Procedures - the low flow/low volume purging is a procedure used to minimize purge water volumes. The pump intake is placed within the screened interval at the zone of sampling, preferably, the zone with the highest flow rate. Low flow rate purging is conducted after hydraulic conditions within the well have re-stabilized. Flow rates should not exceed the recharge rate of the aquifer. This is monitored by measuring the top of the water column with a water level recorder or similar device while pumping. These techniques, however, are only acceptable under certain hydraulic conditions and are not considered standard procedures – specific procedures will be specified in the Sampling and Analysis Plan when used.
 - e. Continue the purge process until at least three well volumes have been removed or the well is pumped dry (unless low flow/low volume purging is used).
 - f. A representative water sample shall be collected at a minimum frequency of once after each well volume is purged. These samples shall be checked in the field to assure that the water quality parameters (pH, temperature, and specific conductance) have stabilized (i.e., readings are within 10% of the previous measurement). If water quality parameters have not stabilized, the purge process is continued. The groundwater purge measurements shall be recorded in the field notes or on a separate *Groundwater Purge Data* form (see attached example of an appropriate groundwater purge data form in Appendix B).
7. Sampling Equipment Available
- a. Peristaltic pump (optional vacuum jug assembly)
 - b. Stainless steel and Teflon[®] bladder pump,
 - c. Stainless steel and Teflon[®], variable speed centrifugal pump (e.g., Grundfos Redi-Flo2[®])
8. Sampling Techniques
- a. Peristaltic pump/vacuum jug
 - i. Precleaned disposable tubing is placed into the pump and from pump to well.
 - ii. Intake is lowered to the appropriate depth.
 - iii. Pump is activated with speed adjusted for appropriate flow rate based on well recharge and types of samples to be collected.
 - iv. Groundwater is discharged into appropriate sample containers.
 - v. The vacuum jug can be used for sample collection as an option because as it allows for sample collection without the sample coming in contact with

the pump tubing. This is accomplished by placing a Teflon[®] transfer cap assembly onto the neck of a standard cleaned 4-liter (1-gallon) glass container. Teflon[®] tubing (¼-inch O.D.) connects the container to both the pump and the sample source. The pump creates a vacuum in the container, thereby drawing the sample into the container without it coming into contact with the pump. Samples for volatile organic compound analysis should be collected using a bailer or by filling intake tube and allowing it to drain into the sample vials.

- b. Submersible bladder Pumps and variable speed centrifugal pumps
 - i. After purging has been accomplished with a bladder pump, the sample is obtained directly from the pump discharge.
 - ii. The pump rate should be reduced during sample collection to minimize sample disturbance, particularly with respect to samples collected for volatile organic compounds analysis.
9. The sample containers are labeled with well number, date, time, and analysis to be conducted. Samples are collected and contained in order of volatilization sensitivity. The preferred collection order for some common groundwater parameters is as follows:
 - a. Volatile organics
 - b. Total organic carbon
 - c. Total petroleum hydrocarbons
 - d. Semi-volatile organics
 - e. Total metals
 - f. Phenols
 - g. Sulfate and chloride
 - h. Nitrate and ammonia
10. All samples are logged on a chain-of-custody form and immediately stored in an ice-filled cooler (maintaining a temperature of approximately 4°C). Samples are transported to the laboratory under EPA approved chain-of-custody procedures.

Appendix B: Soil Boring Logs

Project Location: CVTC	 3e EEE Consulting, Inc. Environmental, Engineering and Educational Solutions
Building/Location: Boiler Plant (Building 77)	
Boring Location: 77-1

Appendix D: Well Diagrams

WELL CONSTRUCTION DIAGRAM

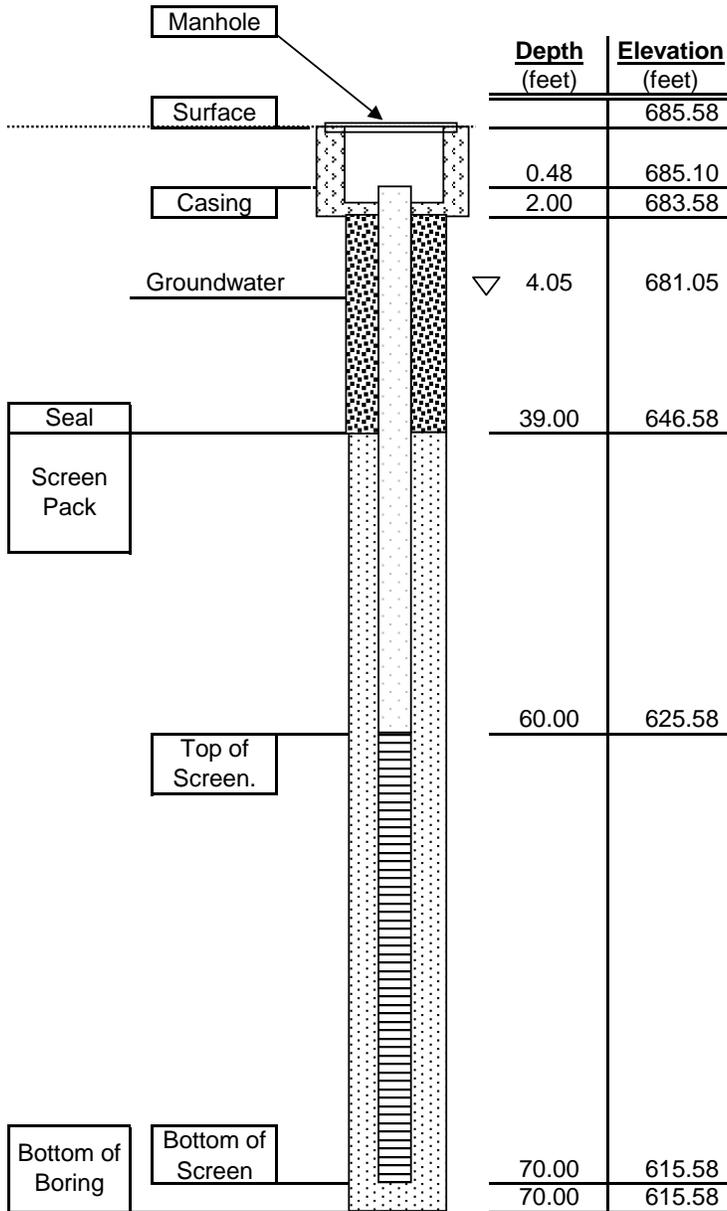

Well No.	77-1
Location	CVTC, Madison Heights, VA
Installation Date	09/19/18
Drilling Method	Air Rotary
Drilling Contractor	Rorrer
Drilling Fluid	water, as needed
Water Removed During Development	30 gallons
Borehole Dia.	6"
Casing Dia.	2"
Casing Type	PVC Schedule 40
Screen Type	PVC, 0.020"
Backfill	Bentonite grout 60/40
Screen Pack	#2 Sand
Water Depth (below TOC)	
Seal	Bentonite, 3/8" granules
Notes	Static water level measured on 9/25/2018

WELL CONSTRUCTION DIAGRAM

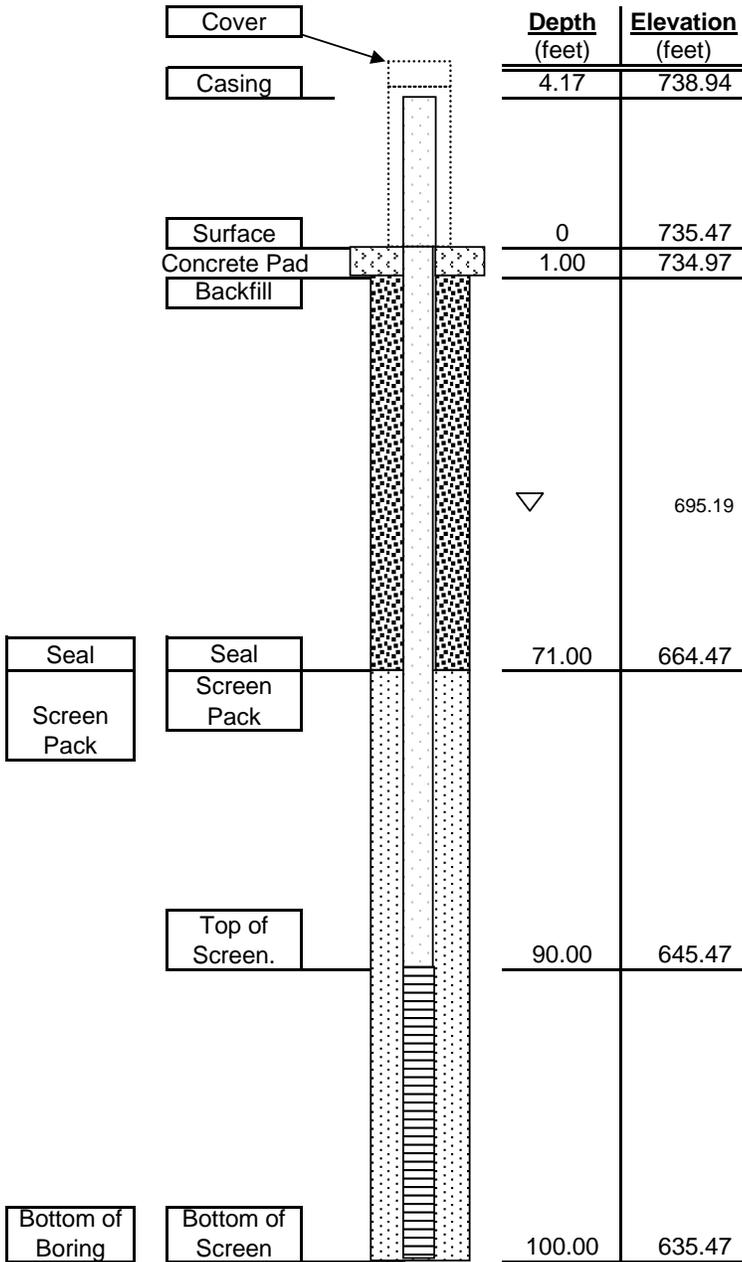

Well No.	77-2
Location	CVTC, Madison Heights, VA
Installation Date	09/19/18
Drilling Method	Air Rotary
Drilling Contractor	Rorrer
Drilling Fluid	water, as needed
Water Removed During Development	35 gallons
Borehole Dia.	6"
Casing Dia.	2"
Casing Type	PVC Schedule 40
Screen Type	PVC, 0.020"
Backfill	Bentonite grout 60/40
Screen Pack	#2 Sand
Water Depth (below TOC)	
Seal	Bentonite, 3/8" granules
Notes	Static water level measured on 9/25/2018

WELL CONSTRUCTION DIAGRAM

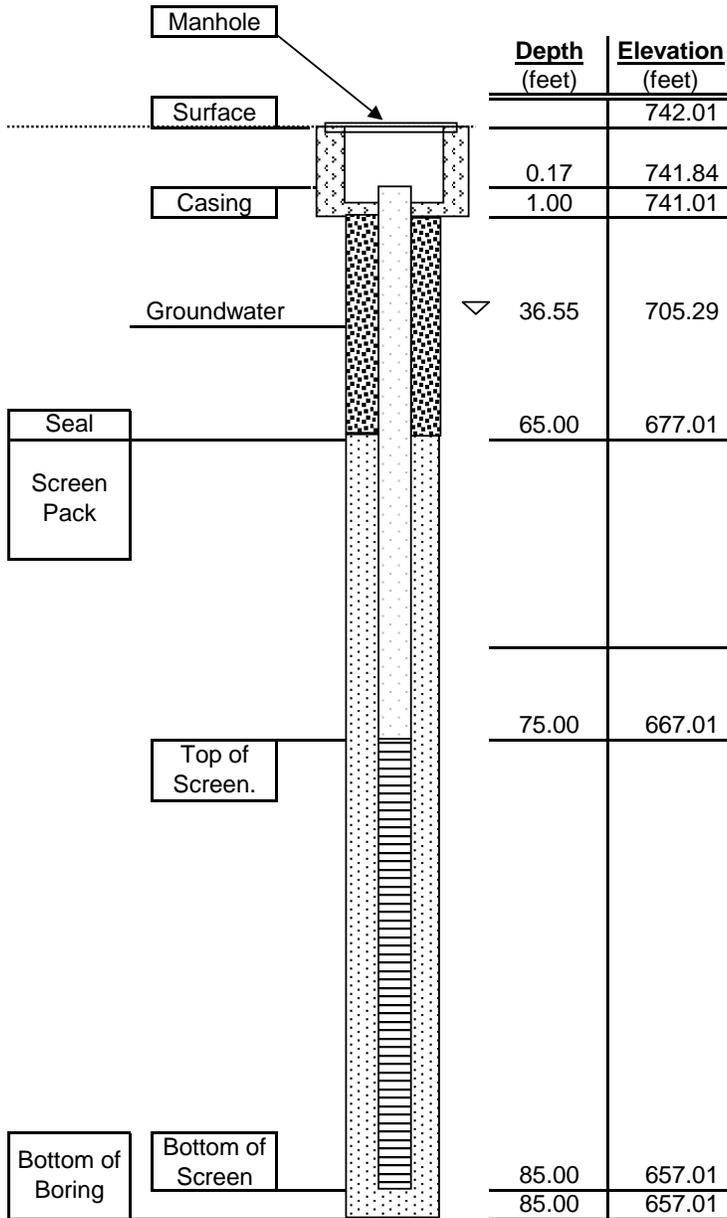

Well No.	77-3
Location	CVTC, Madison Heights, VA
Installation Date	09/19/18
Drilling Method	Air Rotary
Drilling Contractor	Rorrer
Drilling Fluid	water, as needed
Water Removed During Development	30 gallons
Borehole Dia.	6"
Casing Dia.	2"
Casing Type	PVC Schedule 40
Screen Type	PVC, 0.020"
Backfill	Bentonite grout 60/40
Screen Pack	#2 Sand
Water Depth (below TOC)	4.05
Seal	Bentonite, 3/8" granules
Notes	Static water level measured on 9/25/2018

WELL CONSTRUCTION DIAGRAM

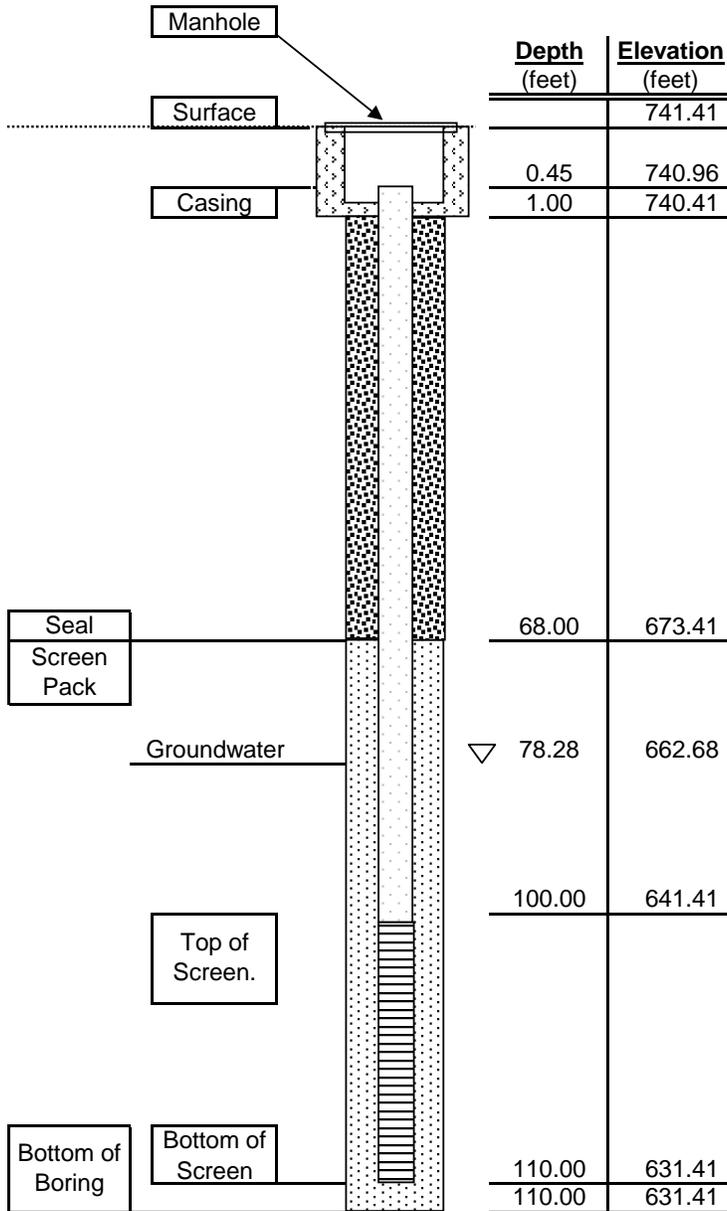

Well No.	39-1
Location	CVTC Madison Heights, VA
Installation Date	09/19/18
Drilling Method	Air Rotary
Drilling Contractor	Rorrer
Drilling Fluid	water, as needed
Water Removed During Development	30 gallons
Borehole Dia.	6"
Casing Dia.	2"
Casing Type	PVC Schedule 40
Screen Type	PVC 0.020"
Backfill	Bentonite grout 60/40
Screen Pack	#2 Sand
Water Depth (below TOC)	43.75
Seal	Bentonite, 3/8" granules
Notes	Static water level measured on 10/2/2017

Enclosed are the results of analyses for samples received by the laboratory on 09/06/2018 08:35. If you have any questions concerning this report, please feel free to contact the laboratory.

Sincerely,

A handwritten signature in black ink that reads "Ted Soyars".

Ted Soyars
Laboratory Manager

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

This report shall not be reproduced except in full without the expressed and written approval of an authorized representative of Air Water & Soil Laboratories, Inc.

Summary of Data Qualifiers

DS Surrogate concentration reflects a dilution factor.

E Estimated concentration, outside calibration range

L LCS recovery is outside of established acceptance limits

M Matrix spike recovery is outside established acceptance limits

M2 Sample was diluted due to matrix interference.

P Duplicate analysis does not meet the acceptance criteria for precision

S Surrogate recovery was outside acceptance criteria

RPD Relative Percent Difference

Qual Qualifiers

-RE Denotes sample was re-analyzed

D.F. Dilution Factor. Please also see the Preparation Factor in the Analysis Summary section.

TIC Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the NIST spectral library . A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern. Compound concentrations are estimated and are calculated using an internal standard response factor of 1.

PCBs, Total Total PCBs are defined as the sum of detected Aroclors 1016, 1221, 1232, 1248, 1254, 1260, 1262, and 1268.

Sample Conditions Checklist

Samples Received at:	2.80°C
How were samples received?	Courier
Were Custody Seals used? If so, were they received intact?	No
Are the custody papers filled out completely and correctly?	Yes
Do all bottle labels agree with custody papers?	Yes
Is the temperature blank or representative sample within acceptable limits? (above freezing to 6°C) or received on ice and recently taken?	Yes
Are all samples within holding time for requested laboratory tests?	Yes
Is a sufficient amount of sample provided to perform the tests included?	Yes
Are all samples in appropriate containers for the analyses requested?	Yes
Were volatile organic containers received?	No
Are all volatile organic and TOX containers free of headspace?	NA
Is a trip blank provided for each VOC sample set? VOC sample sets include EPA8011, EPA504, EPA8260, EPA624, EPA8015 GRO, EPA8021, EPA524, and RSK-175.	NA
Are all samples received appropriately preserved? Note that metals containers do not require field preservation but lab preservation may delay analysis.	Yes

Submitted To: Jeff Fisher

Purchase Order: 18-760

Client Site I.D.: CVTC

Enclosed are the results of analyses for samples received by the laboratory on 09/13/2018 08:00. If you have any questions concerning this report, please feel free to contact the laboratory.

Sincerely,

Ted Soyars
Laboratory Manager

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

This report shall not be reproduced except in full without the expressed and written approval of an authorized representative of Air Water & Soil Laboratories, Inc.

Summary of Data Qualifiers

- B Blank contamination. The recorded result is associated with a contaminated blank.
 - C Continuing calibration verification response for this analyte is outside specifications.
 - DND Not Detected
 - E Estimated concentration, outside calibration range
 - M Matrix spike recovery is outside established acceptance limits
 - M2 Sample was diluted due to matrix interference.
 - P Duplicate analysis does not meet the acceptance criteria for precision
 - RPD Relative Percent Difference
 - Qual Qualifiers
 - RE Denotes sample was re-analyzed
 - D.F. Dilution Factor. Please also see the Preparation Factor in the Analysis Summary section.
 - TIC Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the NIST spectral library . A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern. Compound concentrations are estimated and are calculated using an internal standard response factor of 1.
- PCBs, Total Total PCBs are defined as the sum of detected Aroclors 1016, 1221, 1232, 1248, 1254, 1260, 1262, and 1268.

Sample Conditions Checklist

Samples Received at:	1.60°C
How were samples received?	Courier
Were Custody Seals used? If so, were they received intact?	No
Are the custody papers filled out completely and correctly?	Yes
Do all bottle labels agree with custody papers?	Yes
Is the temperature blank or representative sample within acceptable limits? (above freezing to 6°C) or received on ice and recently taken?	Yes
Are all samples within holding time for requested laboratory tests?	Yes
Is a sufficient amount of sample provided to perform the tests included?	Yes
Are all samples in appropriate containers for the analyses requested?	Yes
Were volatile organic containers received?	No
Are all volatile organic and TOX containers free of headspace?	NA
Is a trip blank provided for each VOC sample set? VOC sample sets include EPA8011, EPA504, EPA8260, EPA624, EPA8015 GRO, EPA8021, EPA524, and RSK-175.	NA
Are all samples received appropriately preserved? Note that metals containers do not require field preservation but lab preservation may delay analysis.	Yes

As per Jeff Fisher, certification for 2,3,7,8 TCDD SIM is not necessary. MMR 9/13/18 15:17

Client Site I.D.: CVTC

Enclosed are the results of analyses for samples received by the laboratory on 09/13/2018 08:00. If you have any questions concerning this report, please feel free to contact the laboratory.

Sincerely,

A handwritten signature in black ink that reads "Ted Soyars".

Ted Soyars
Laboratory Manager

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

This report shall not be reproduced except in full without the expressed and written approval of an authorized representative of Air Water & Soil Laboratories, Inc.

Summary of Data Qualifiers

- B Blank contamination. The recorded result is associated with a contaminated blank.
- C Continuing calibration verification response for this analyte is outside specifications.
- DND Not Detected
- DS Surrogate concentration reflects a dilution factor.
- E Estimated concentration, outside calibration range
- M Matrix spike recovery is outside established acceptance limits
- M2 Sample was diluted due to matrix interference.
- P Duplicate analysis does not meet the acceptance criteria for precision
- RPD Relative Percent Difference
- Qual Qualifiers
- RE Denotes sample was re-analyzed
- D.F. Dilution Factor. Please also see the Preparation Factor in the Analysis Summary section.
- TIC Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the NIST spectral library . A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern. Compound concentrations are estimated and are calculated using an internal standard response factor of 1.
- PCBs, Total Total PCBs are defined as the sum of detected Aroclors 1016, 1221, 1232, 1248, 1254, 1260, 1262, and 1268.

Sample Conditions Checklist

Samples Received at:	1.60°C
How were samples received?	Courier
Were Custody Seals used? If so, were they received intact?	No
Are the custody papers filled out completely and correctly?	Yes
Do all bottle labels agree with custody papers?	Yes
Is the temperature blank or representative sample within acceptable limits? (above freezing to 6°C) or received on ice and recently taken?	Yes
Are all samples within holding time for requested laboratory tests?	Yes
Is a sufficient amount of sample provided to perform the tests included?	Yes
Are all samples in appropriate containers for the analyses requested?	Yes
Were volatile organic containers received?	No
Are all volatile organic and TOX containers free of headspace?	NA
Is a trip blank provided for each VOC sample set? VOC sample sets include EPA8011, EPA504, EPA8260, EPA624, EPA8015 GRO, EPA8021, EPA524, and RSK-175.	NA
Are all samples received appropriately preserved? Note that metals containers do not require field preservation but lab preservation may delay analysis.	Yes

Client Site I.D.: CVTC

Enclosed are the results of analyses for samples received by the laboratory on 09/13/2018 08:00. If you have any questions concerning this report, please feel free to contact the laboratory.

Sincerely,

Ted Soyars
Laboratory Manager

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

This report shall not be reproduced except in full without the expressed and written approval of an authorized representative of Air Water & Soil Laboratories, Inc.

Summary of Data Qualifiers

- B Blank contamination. The recorded result is associated with a contaminated blank.
- C Continuing calibration verification response for this analyte is outside specifications.
- DND Not Detected
- DS Surrogate concentration reflects a dilution factor.
- E Estimated concentration, outside calibration range
- M Matrix spike recovery is outside established acceptance limits
- M2 Sample was diluted due to matrix interference.
- P Duplicate analysis does not meet the acceptance criteria for precision
- S Surrogate recovery was outside acceptance criteria
- RPD Relative Percent Difference
- Qual Qualifiers
- RE Denotes sample was re-analyzed
- D.F. Dilution Factor. Please also see the Preparation Factor in the Analysis Summary section.
- TIC Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the NIST spectral library . A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern. Compound concentrations are estimated and are calculated using an internal standard response factor of 1.
- PCBs, Total Total PCBs are defined as the sum of detected Aroclors 1016, 1221, 1232, 1248, 1254, 1260, 1262, and 1268.

Sample Conditions Checklist

Samples Received at:	1.60°C
How were samples received?	Courier
Were Custody Seals used? If so, were they received intact?	No
Are the custody papers filled out completely and correctly?	Yes
Do all bottle labels agree with custody papers?	Yes
Is the temperature blank or representative sample within acceptable limits? (above freezing to 6°C) or received on ice and recently taken?	Yes
Are all samples within holding time for requested laboratory tests?	Yes
Is a sufficient amount of sample provided to perform the tests included?	Yes
Are all samples in appropriate containers for the analyses requested?	Yes
Were volatile organic containers received?	No
Are all volatile organic and TOX containers free of headspace?	NA
Is a trip blank provided for each VOC sample set? VOC sample sets include EPA8011, EPA504, EPA8260, EPA624, EPA8015 GRO, EPA8021, EPA524, and RSK-175.	NA
Are all samples received appropriately preserved? Note that metals containers do not require field preservation but lab preservation may delay analysis.	Yes

As per Jeff Fisher, certification for 2,3,7,8 TCDD SIM not necessary. MMR 9/13/18

Enclosed are the results of analyses for samples received by the laboratory on 09/13/2018 08:00. If you have any questions concerning this report, please feel free to contact the laboratory.

Sincerely,

Ted Soyars
Laboratory Manager

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

This report shall not be reproduced except in full without the expressed and written approval of an authorized representative of Air Water & Soil Laboratories, Inc.

Summary of Data Qualifiers

B Blank contamination. The recorded result is associated with a contaminated blank.

E Estimated concentration, outside calibration range

M Matrix spike recovery is outside established acceptance limits

M2 Sample was diluted due to matrix interference.

P Duplicate analysis does not meet the acceptance criteria for precision

S Surrogate recovery was outside acceptance criteria

RPD Relative Percent Difference

Qual Qualifiers

-RE Denotes sample was re-analyzed

D.F. Dilution Factor. Please also see the Preparation Factor in the Analysis Summary section.

TIC Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the NIST spectral library . A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern. Compound concentrations are estimated and are calculated using an internal standard response factor of 1.

PCBs, Total Total PCBs are defined as the sum of detected Aroclors 1016, 1221, 1232, 1248, 1254, 1260, 1262, and 1268.

Sample Conditions Checklist

Samples Received at:	1.60°C
How were samples received?	Courier
Were Custody Seals used? If so, were they received intact?	No
Are the custody papers filled out completely and correctly?	Yes
Do all bottle labels agree with custody papers?	Yes
Is the temperature blank or representative sample within acceptable limits? (above freezing to 6°C) or received on ice and recently taken?	Yes
Are all samples within holding time for requested laboratory tests?	Yes
Is a sufficient amount of sample provided to perform the tests included?	Yes
Are all samples in appropriate containers for the analyses requested?	Yes
Were volatile organic containers received?	No
Are all volatile organic and TOX containers free of headspace?	NA
Is a trip blank provided for each VOC sample set? VOC sample sets include EPA8011, EPA504, EPA8260, EPA624, EPA8015 GRO, EPA8021, EPA524, and RSK-175.	NA
Are all samples received appropriately preserved? Note that metals containers do not require field preservation but lab preservation may delay analysis.	Yes

As per Jeff Fisher, certification for 2,3,7,8 TCDD SIM not necessary. MMR 9/13/18 15:17

Enclosed are the results of analyses for samples received by the laboratory on 09/20/2018 08:00. If you have any questions concerning this report, please feel free to contact the laboratory.

Sincerely,

A handwritten signature in black ink that reads "Ted Soyars".

Ted Soyars
Laboratory Manager

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

This report shall not be reproduced except in full without the expressed and written approval of an authorized representative of Air Water & Soil Laboratories, Inc.

Summary of Data Qualifiers

DS Surrogate concentration reflects a dilution factor.

H Analysis was performed outside of the method prescribed holding time.

M Matrix spike recovery is outside established acceptance limits

M2 Sample was diluted due to matrix interference.

P Duplicate analysis does not meet the acceptance criteria for precision

S Surrogate recovery was outside acceptance criteria

RPD Relative Percent Difference

Qual Qualifiers

-RE Denotes sample was re-analyzed

D.F. Dilution Factor. Please also see the Preparation Factor in the Analysis Summary section.

TIC Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the NIST spectral library . A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern. Compound concentrations are estimated and are calculated using an internal standard response factor of 1.

PCBs, Total Total PCBs are defined as the sum of detected Aroclors 1016, 1221, 1232, 1248, 1254, 1260, 1262, and 1268.

Sample Conditions Checklist

Samples Received at:	0.80°C
How were samples received?	Courier
Were Custody Seals used? If so, were they received intact?	No
Are the custody papers filled out completely and correctly?	Yes
Do all bottle labels agree with custody papers?	Yes
Is the temperature blank or representative sample within acceptable limits? (above freezing to 6°C) or received on ice and recently taken?	Yes
Are all samples within holding time for requested laboratory tests?	Yes
Is a sufficient amount of sample provided to perform the tests included?	Yes
Are all samples in appropriate containers for the analyses requested?	Yes
Were volatile organic containers received?	No
Are all volatile organic and TOX containers free of headspace?	NA
Is a trip blank provided for each VOC sample set? VOC sample sets include EPA8011, EPA504, EPA8260, EPA624, EPA8015 GRO, EPA8021, EPA524, and RSK-175.	NA
Are all samples received appropriately preserved? Note that metals containers do not require field preservation but lab preservation may delay analysis.	Yes

Client Site I.D.: CVTC

Enclosed are the results of analyses for samples received by the laboratory on 09/27/2018 08:00. If you have any questions concerning this report, please feel free to contact the laboratory.

Sincerely,

Ted Soyars
Laboratory Manager

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

This report shall not be reproduced except in full without the expressed and written approval of an authorized representative of Air Water & Soil Laboratories, Inc.

Summary of Data Qualifiers

- B Blank contamination. The recorded result is associated with a contaminated blank.
- C Continuing calibration verification response for this analyte is outside specifications.
- DND Not Detected
- DS Surrogate concentration reflects a dilution factor.
- L LCS recovery is outside of established acceptance limits
- M Matrix spike recovery is outside established acceptance limits
- M2 Sample was diluted due to matrix interference.
- P Duplicate analysis does not meet the acceptance criteria for precision
- S Surrogate recovery was outside acceptance criteria
- RPD Relative Percent Difference
- Qual Qualifiers
- RE Denotes sample was re-analyzed
- D.F. Dilution Factor. Please also see the Preparation Factor in the Analysis Summary section.
- TIC Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the NIST spectral library . A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern. Compound concentrations are estimated and are calculated using an internal standard response factor of 1.
- PCBs, Total Total PCBs are defined as the sum of detected Aroclors 1016, 1221, 1232, 1248, 1254, 1260, 1262, and 1268.

Sample Conditions Checklist

Samples Received at:	2.70°C
How were samples received?	Courier
Were Custody Seals used? If so, were they received intact?	No
Are the custody papers filled out completely and correctly?	Yes
Do all bottle labels agree with custody papers?	Yes
Is the temperature blank or representative sample within acceptable limits? (above freezing to 6°C) or received on ice and recently taken?	Yes
Are all samples within holding time for requested laboratory tests?	Yes
Is a sufficient amount of sample provided to perform the tests included?	Yes
Are all samples in appropriate containers for the analyses requested?	Yes
Were volatile organic containers received?	No
Are all volatile organic and TOX containers free of headspace?	NA
Is a trip blank provided for each VOC sample set? VOC sample sets include EPA8011, EPA504, EPA8260, EPA624, EPA8015 GRO, EPA8021, EPA524, and RSK-175.	NA
Are all samples received appropriately preserved? Note that metals containers do not require field preservation but lab preservation may delay analysis.	Yes

Enclosed are the results of analyses for samples received by the laboratory on 09/28/2018 08:00. If you have any questions concerning this report, please feel free to contact the laboratory.

Sincerely,

Ted Soyars
Laboratory Manager

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

This report shall not be reproduced except in full without the expressed and written approval of an authorized representative of Air Water & Soil Laboratories, Inc.

Summary of Data Qualifiers

- B Blank contamination. The recorded result is associated with a contaminated blank.
 - C Continuing calibration verification response for this analyte is outside specifications.
 - E Estimated concentration, outside calibration range
 - L LCS recovery is outside of established acceptance limits
 - M Matrix spike recovery is outside established acceptance limits
 - M2 Sample was diluted due to matrix interference.
 - P Duplicate analysis does not meet the acceptance criteria for precision
 - S Surrogate recovery was outside acceptance criteria
 - RPD Relative Percent Difference
 - Qual Qualifiers
 - RE Denotes sample was re-analyzed
 - D.F. Dilution Factor. Please also see the Preparation Factor in the Analysis Summary section.
 - TIC Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the NIST spectral library . A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern. Compound concentrations are estimated and are calculated using an internal standard response factor of 1.
- PCBs, Total Total PCBs are defined as the sum of detected Aroclors 1016, 1221, 1232, 1248, 1254, 1260, 1262, and 1268.

Sample Conditions Checklist

Samples Received at:	0.50°C
How were samples received?	Courier
Were Custody Seals used? If so, were they received intact?	No
Are the custody papers filled out completely and correctly?	No
Do all bottle labels agree with custody papers?	Yes
Is the temperature blank or representative sample within acceptable limits? (above freezing to 6°C) or received on ice and recently taken?	Yes
Are all samples within holding time for requested laboratory tests?	Yes
Is a sufficient amount of sample provided to perform the tests included?	Yes
Are all samples in appropriate containers for the analyses requested?	Yes
Were volatile organic containers received?	Yes
Are all volatile organic and TOX containers free of headspace?	Yes
Is a trip blank provided for each VOC sample set? VOC sample sets include EPA8011, EPA504, EPA8260, EPA624, EPA8015 GRO, EPA8021, EPA524, and RSK-175.	Yes
Are all samples received appropriately preserved? Note that metals containers do not require field preservation but lab preservation may delay analysis.	Yes

Work Order Comments

Trip Blank received with samples and added to work order . Trip Blank date and time (08/23/18 1410) logged as per container labels. BAR 09/28/18 0850

Date Received: October 2, 2018 8:10
Date Issued: October 9, 2018 16:18

Project Number: 18-760

Submitted To: Jeff Fisher

Purchase Order: 18-760

Client Site I.D.: CVTC

Enclosed are the results of analyses for samples received by the laboratory on 10/02/2018 08:10. If you have any questions concerning this report, please feel free to contact the laboratory.

Sincerely,

Ted Soyars
Laboratory Manager

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

This report shall not be reproduced except in full without the expressed and written approval of an authorized representative of Air Water & Soil Laboratories, Inc.

Summary of Data Qualifiers

C Continuing calibration verification response for this analyte is outside specifications.

E Estimated concentration, outside calibration range

L LCS recovery is outside of established acceptance limits

M Matrix spike recovery is outside established acceptance limits

M2 Sample was diluted due to matrix interference.

P Duplicate analysis does not meet the acceptance criteria for precision

S Surrogate recovery was outside acceptance criteria

RPD Relative Percent Difference

Qual Qualifiers

-RE Denotes sample was re-analyzed

D.F. Dilution Factor. Please also see the Preparation Factor in the Analysis Summary section.

TIC Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the NIST spectral library . A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern. Compound concentrations are estimated and are calculated using an internal standard response factor of 1.

PCBs, Total Total PCBs are defined as the sum of detected Aroclors 1016, 1221, 1232, 1248, 1254, 1260, 1262, and 1268.

Certificate of Analysis

Final Report

Client Name:	EEE Consulting (Blacksburg, VA) 201 Church Street Blacksburg VA, 24060	Date Issued:	10/9/2018 16:18
Submitted To:	Jeff Fisher	Project Number:	18-760
Client Site I.D.:	CVTC	Purchase Order:	18-760

Sample Conditions Checklist

Samples Received at:	3.90°C
How were samples received?	Walk In
Were Custody Seals used? If so, were they received intact?	No
Are the custody papers filled out completely and correctly?	No
Do all bottle labels agree with custody papers?	Yes
Is the temperature blank or representative sample within acceptable limits? (above freezing to 6°C) or received on ice and recently taken?	Yes
Are all samples within holding time for requested laboratory tests?	Yes
Is a sufficient amount of sample provided to perform the tests included?	Yes
Are all samples in appropriate containers for the analyses requested?	Yes
Were volatile organic containers received?	Yes
Are all volatile organic and TOX containers free of headspace?	Yes
Is a trip blank provided for each VOC sample set? VOC sample sets include EPA8011, EPA504, EPA8260, EPA624, EPA8015 GRO, EPA8021, EPA524, and RSK-175.	Yes
Are all samples received appropriately preserved? Note that metals containers do not require field preservation but lab preservation may delay analysis.	Yes

Work Order Comments

Trip Blank received with samples and added to work order. Trip Blank date and time (08/23/18 1410) logged as per container labels. BAR 10/02/18 0856

Enclosed are the results of analyses for samples received by the laboratory on 10/03/2018 08:09. If you have any questions concerning this report, please feel free to contact the laboratory.

Sincerely,

A handwritten signature in black ink that reads "Ted Soyars".

Ted Soyars
Laboratory Manager

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

This report shall not be reproduced except in full without the expressed and written approval of an authorized representative of Air Water & Soil Laboratories, Inc.

Summary of Data Qualifiers

C Continuing calibration verification response for this analyte is outside specifications.

Cl Residual Chlorine or other oxidizing agent was detected in the container used to analyze this sample.

DND Not Detected

E Estimated concentration, outside calibration range

L LCS recovery is outside of established acceptance limits

M Matrix spike recovery is outside established acceptance limits

P Duplicate analysis does not meet the acceptance criteria for precision

S Surrogate recovery was outside acceptance criteria

RPD Relative Percent Difference

Qual Qualifiers

-RE Denotes sample was re-analyzed

D.F. Dilution Factor. Please also see the Preparation Factor in the Analysis Summary section.

TIC Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the NIST spectral library . A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern. Compound concentrations are estimated and are calculated using an internal standard response factor of 1.

PCBs, Total Total PCBs are defined as the sum of detected Aroclors 1016, 1221, 1232, 1248, 1254, 1260, 1262, and 1268.

Certificate of Analysis

Final Report

Client Name:	EEE Consulting (Blacksburg, VA) 201 Church Street Blacksburg VA, 24060	Date Issued:	10/10/2018 16:12
Submitted To:	Jeff Fisher	Project Number:	18-760
Client Site I.D.:	CVTC	Purchase Order:	18-760

Sample Conditions Checklist

Samples Received at:	5.70°C
How were samples received?	Walk In
Were Custody Seals used? If so, were they received intact?	No
Are the custody papers filled out completely and correctly?	No
Do all bottle labels agree with custody papers?	Yes
Is the temperature blank or representative sample within acceptable limits? (above freezing to 6°C) or received on ice and recently taken?	Yes
Are all samples within holding time for requested laboratory tests?	Yes
Is a sufficient amount of sample provided to perform the tests included?	Yes
Are all samples in appropriate containers for the analyses requested?	Yes
Were volatile organic containers received?	Yes
Are all volatile organic and TOX containers free of headspace?	Yes
Is a trip blank provided for each VOC sample set? VOC sample sets include EPA8011, EPA504, EPA8260, EPA624, EPA8015 GRO, EPA8021, EPA524, and RSK-175.	No
Are all samples received appropriately preserved? Note that metals containers do not require field preservation but lab preservation may delay analysis.	Yes

Work Order Comments

Trip Blank for GRO and VOC 8260 received with samples and added to work order. Trip Blank date and time (08/23/18 1410) logged as per container label. BAR 10/03/18 0910.

No Trip Blank received for VOC8011. Jeff Fisher notified via email. BAR 10/03/18 0910

Samples logged for Tbl 3.1B and 2,3,7,8 TCDD as per project requirements. MMR 10/3/18

Enclosed are the results of analyses for samples received by the laboratory on 10/04/2018 08:05. If you have any questions concerning this report, please feel free to contact the laboratory.

Sincerely,

Ted Soyars
Laboratory Manager

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

This report shall not be reproduced except in full without the expressed and written approval of an authorized representative of Air Water & Soil Laboratories, Inc.

Summary of Data Qualifiers

- B Blank contamination. The recorded result is associated with a contaminated blank.
 - C Continuing calibration verification response for this analyte is outside specifications.
 - CN See case narrative
 - DND Not Detected
 - E Estimated concentration, outside calibration range
 - L LCS recovery is outside of established acceptance limits
 - M Matrix spike recovery is outside established acceptance limits
 - P Duplicate analysis does not meet the acceptance criteria for precision
 - S Surrogate recovery was outside acceptance criteria
 - RPD Relative Percent Difference
 - Qual Qualifiers
 - RE Denotes sample was re-analyzed
 - D.F. Dilution Factor. Please also see the Preparation Factor in the Analysis Summary section.
 - TIC Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the NIST spectral library . A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern. Compound concentrations are estimated and are calculated using an internal standard response factor of 1.
- PCBs, Total Total PCBs are defined as the sum of detected Aroclors 1016, 1221, 1232, 1248, 1254, 1260, 1262, and 1268.

Sample Conditions Checklist

Samples Received at:	4.80°C
How were samples received?	Walk In
Were Custody Seals used? If so, were they received intact?	No
Are the custody papers filled out completely and correctly?	No
Do all bottle labels agree with custody papers?	Yes
Is the temperature blank or representative sample within acceptable limits? (above freezing to 6°C) or received on ice and recently taken?	Yes
Are all samples within holding time for requested laboratory tests?	Yes
Is a sufficient amount of sample provided to perform the tests included?	Yes
Are all samples in appropriate containers for the analyses requested?	Yes
Were volatile organic containers received?	Yes
Are all volatile organic and TOX containers free of headspace?	Yes
Is a trip blank provided for each VOC sample set? VOC sample sets include EPA8011, EPA504, EPA8260, EPA624, EPA8015 GRO, EPA8021, EPA524, and RSK-175.	Yes
Are all samples received appropriately preserved? Note that metals containers do not require field preservation but lab preservation may delay analysis.	Yes

Laboratory Order ID 18J0250

Client Name: EEE Consulting (Blacksburg, VA)
201 Church Street
Blacksburg, VA 24060

Date Received: October 5, 2018 8:00

Date Issued: October 12, 2018 15:27

Project Number: 18-760

Submitted To: Jeff Fisher

Purchase Order: 18-760

Client Site I.D.: CVTC

Enclosed are the results of analyses for samples received by the laboratory on 10/05/2018 08:00. If you have any questions concerning this report, please feel free to contact the laboratory.

Sincerely,

A handwritten signature in black ink that reads "Ted Soyars".

Ted Soyars
Laboratory Manager

End Notes:

The test results listed in this report relate only to the samples submitted to the laboratory and as received by the Laboratory.

Unless otherwise noted, the test results for solid materials are calculated on a wet weight basis. Analyses for pH, dissolved oxygen, temperature, residual chlorine and sulfite that are performed in the laboratory do not meet NELAC requirements due to extremely short holding times. These analyses should be performed in the field. The results of field analyses performed by the Sampler included in the Certificate of Analysis are done so at the client's request and are not included in the laboratory's fields of certification nor have they been audited for adherence to a reference method or procedure.

The signature on the final report certifies that these results conform to all applicable NELAC standards unless otherwise specified. For a complete list of the Laboratory's NELAC certified parameters please contact customer service.

This report shall not be reproduced except in full without the expressed and written approval of an authorized representative of Air Water & Soil Laboratories, Inc.

Summary of Data Qualifiers

- B Blank contamination. The recorded result is associated with a contaminated blank.
- C Continuing calibration verification response for this analyte is outside specifications.
- Cl Residual Chlorine or other oxidizing agent was detected in the container used to analyze this sample.
- DND Not Detected
- E Estimated concentration, outside calibration range
- L LCS recovery is outside of established acceptance limits
- M Matrix spike recovery is outside established acceptance limits
- P Duplicate analysis does not meet the acceptance criteria for precision
- S Surrogate recovery was outside acceptance criteria
- RPD Relative Percent Difference
- Qual Qualifiers
- RE Denotes sample was re-analyzed
- D.F. Dilution Factor. Please also see the Preparation Factor in the Analysis Summary section.
- TIC Tentatively Identified Compounds are compounds that are identified by comparing the analyte mass spectral pattern with the NIST spectral library . A TIC spectral match is reported when the pattern is at least 75% consistent with the published pattern. Compound concentrations are estimated and are calculated using an internal standard response factor of 1.
- PCBs, Total Total PCBs are defined as the sum of detected Aroclors 1016, 1221, 1232, 1248, 1254, 1260, 1262, and 1268.

Sample Conditions Checklist

Samples Received at:	2.30°C
How were samples received?	Courier
Were Custody Seals used? If so, were they received intact?	No
Are the custody papers filled out completely and correctly?	No
Do all bottle labels agree with custody papers?	Yes
Is the temperature blank or representative sample within acceptable limits? (above freezing to 6°C) or received on ice and recently taken?	Yes
Are all samples within holding time for requested laboratory tests?	Yes
Is a sufficient amount of sample provided to perform the tests included?	Yes
Are all samples in appropriate containers for the analyses requested?	Yes
Were volatile organic containers received?	Yes
Are all volatile organic and TOX containers free of headspace?	Yes
Is a trip blank provided for each VOC sample set? VOC sample sets include EPA8011, EPA504, EPA8260, EPA624, EPA8015 GRO, EPA8021, EPA524, and RSK-175.	No
Are all samples received appropriately preserved? Note that metals containers do not require field preservation but lab preservation may delay analysis.	Yes

Work Order Comments

Trip Blank for VOC8260 received with samples and added to work order. Trip Blank date and time (08/23/18 1410) logged as per container label. BAR 10/05/18 0904

No Trip Blank received for VOC8011. Jeff Fisher notified via email. BAR 10/05/18 0904

Samples logged for Tbl 3.1B and 2,3,7,8 TCDD as per project requirements. SWS10/5/18

TECHNICAL MEMO TO FILE

CVTC Monitoring Well Installation Access Road

September 10, 2018

On Tuesday, September 4th, 3e staff (Jeff Fisher, Josh Hepler, and Katie Shoemaker) performed a site evaluation for the installation of groundwater monitoring wells in the vicinity of the historic landfill associated with the former coal-powered incinerator to the southeast of the CVTC campus. Williams Run, a tributary to the nearby James River, is approximately 400 feet away from the toe of the landfill, as shown on Figure 13-1. The primary purpose of the site visit was to determine the most feasible path to create a temporary access road to install one or more groundwater monitoring wells downhill of the landfill to intercept the potential groundwater flow paths from the landfill for sampling.

The initial concept was to design a road traversing along the slope adjacent to the property line. The excessively steep slope in this area, greater than 50%, was a limiting factor to even traversing the slope tangentially, which would have resulted in extensive cut and fill to provide a stable driving surface. Alternative paths crossing further into the adjacent property were discussed in the field.

Since a portion of the proposed monitoring well installation will occur in areas within the floodplain of a perennial stream, a preliminary site assessment was conducted to determine if wetlands were present within the proposed footprint. Soils in the area exhibited redoximorphic features and reduced soil conditions typically associated with a depleted matrix, which are all considered indicators of hydric soils. Soils were saturated within 12 inches of soil surface during the growing season, thus meeting wetland hydrology requirements. Hydrophytic vegetation dominated the area, meeting regulatory criteria for wetland vegetation. A formal wetland delineation was not performed; however, site conditions indicate a significant portion of the proposed well installation area meets the regulatory criteria for jurisdictional wetlands. Meeting these criteria means that additional permitting and regulatory oversight would be required if an access road were to be installed through this area.

While alternative paths for the access road were discussed, any feasible path would take the access road through what are assumed to be jurisdictional wetlands. The regulatory oversight anticipated for any road installation through jurisdictional wetlands was deemed to be cost- and time-prohibitive for the project. The alternative of manually installing monitoring wells in the floodplain area was determined to be the most effective solution in this situation. Without the use of heavy equipment for installation, impacts to the wetlands requiring regulatory oversight can be avoided and the necessary sampling can occur in a timely and cost-effective manner.
